

**Edwards Aquifer Habitat Conservation Plan**  
**Expanded Water Quality Monitoring Report**

**January 2017**

## EXECUTIVE SUMMARY

The Edwards Aquifer Habitat Conservation Plan (EAHCP) Expanded Water Quality Monitoring Program was developed in accordance with the directives of the EAHCP to identify and assess potential impairments to water quality within the Comal River and headwaters of the San Marcos River systems. The expanded EAHCP sampling requirements are described in the *2016 Edwards Aquifer Authority Water Quality Monitoring Program Work Plan for Comal Springs and San Marcos* (Edwards Aquifer Habitat Conservation Plan [EAHCP] Work Plan) (EAA 2015). The program includes surface water (base flow) sampling, sediment sampling, real-time instrument water quality monitoring, stormwater sampling and passive diffusion sampling. The EAA contracted with SWCA Environmental Consultants (SWCA) to execute the expanded sampling program in 2014, 2015, and 2016, with the exception of RTI water quality monitoring, which is still conducted by the EAA. A groundwater sampling element was also included in the sampling program, which was to be conducted during periods of extremely low spring flow from Comal and San Marcos springs. Spring flow rates remained above minimum flow rates of 30 cubic feet per second (cfs) at Comal Springs and above 50 cfs at San Marcos Springs during 2016 and, therefore, the groundwater sampling element was not conducted.

The Comal Springs complex has five sample locations along the Comal system from the upstream end of Landa Lake (where Blieders Creek empties into the headwaters of Landa Lake) to the south end of the Comal River, upstream of the confluence with the Guadalupe River. In the San Marcos system, samples are collected at seven locations. Sample sites begin at Sink Creek upstream of the headwaters of Spring Lake on the north end of the system and end downstream of Capes Dam on the south end of the system.

Surface water (base flow) and stormwater samples were collected twice annually from each spring complex. Sediment samples were collected once annually from each spring complex. Passive diffusion samplers were deployed in each spring complex for two week periods, six times per year.

There were a limited number of detections above comparative standards, which is indicative of generally high water quality. Bis(2-ethylhexyl) phthalate was detected above the Texas Risk Reduction Program Protective Concentration Level (PCL) in several surface and stormwater samples in 2016 but may be a laboratory or sampling equipment artifact. Total polycyclic aromatic hydrocarbons (PAHs) were detected above the Probable Effect Concentration (PEC) for sediment samples collected in each year of the sampling program at two locations in the San Marcos Springs complex. Lead was detected above the PEC at one sample location (HSM340- City Park and Hopkins Street) in the San Marcos Springs complex in 2014 and 2016.

## 1.0 INTRODUCTION

The Edwards Aquifer Authority (EAA) and its predecessor agency, the Edwards Underground Water District (EUWD), in cooperation with the U.S. Geological Survey (USGS) and the Texas Water Development Board (TWDB) have maintained a water quality sampling program since 1968. Analyses of these data have been used by the EAA to assess aquifer water quality. This routine or historical sampling program involves the analyses of a broad spectrum of parameters in wells, springs, and streams across the region. The EAA's existing sampling program was expanded with the adoption of the Edwards Aquifer Habitat Conservation Program (EAHCP) to include collection of additional samples and sample types in the immediate vicinity of Comal and San Marcos Springs. The expanded water quality sampling program was developed in accordance with the directives of the EAHCP to identify and assess potential impairments to water quality within the Comal River and headwaters of the San Marcos River systems. The expanded EAHCP sampling requirements are described in the *2016 Edwards Aquifer Authority Water Quality Monitoring Program Work Plan for Comal Springs and San Marcos* (Edwards Aquifer Habitat Conservation Plan [EAHCP] Work Plan) (EAA 2015), which is included in Appendix A of this document.

Based on the requirements of the EAHCP Work Plan, the expanded sampling program requires the collection of the following sample types:

1. Surface water (base flow) samples
2. Sediment samples
3. Real-time instrument (RTI) water quality monitoring
4. Stormwater sampling
5. Passive Diffusion Samplers (PDS)

The EAA contracted with SWCA Environmental Consultants (SWCA) to execute the expanded sampling program in 2014, 2015, and 2016, with the exception of RTI water quality monitoring, which is still conducted by the EAA. Surface water quality monitoring was enhanced beginning in 2014 by the addition of PDS for trace organic compounds analyses, conducted by SWCA. A groundwater sampling element was also included in the sampling program, which was to be conducted during periods of extremely low spring flow from Comal and San Marcos springs. The groundwater sampling element of the sampling program was only to be conducted if spring flow rates dropped below 30 cubic feet per second (cfs) at Comal Springs or below 50 cfs at San Marcos Springs. Spring flow rates remained above 30 cfs at Comal Springs and above 50 cfs at San Marcos Springs during 2016 and, therefore, the groundwater sampling element was not conducted. Hydrographs of spring flow are presented in Appendix B.

Prior to the implementation of the EAHCP, the historical sampling program had not specifically addressed surface water quality, sediment quality, real-time changes for basic water quality parameters, or stormwater impacts along the Comal River or headwaters of the San Marcos River. Therefore, this expanded sampling program was designed to gather data specific to all of the new parameters. This report presents the surface water, sediment, stormwater and PDS data collected by SWCA in 2016. The data set represents the fourth year of the program and is not sufficient to establish any long-term trends or patterns.

For purposes of this report, the Comal River may also be referred to as Comal Springs or Comal Springs complex, and the San Marcos River headwaters may also be referred to as San Marcos Springs or San

Marcos Springs complex. An overview of surface water, sediment, and stormwater sample locations for Comal and San Marcos springs are shown in Figures 1 and 2. Figures 3–6 provide detailed location data for sample points at the Comal Springs complex. Figures 7–10 provide detailed locations for the sample points at the San Marcos Springs complex.

### **1.1 Surface Water (Base Flow) Samples**

Surface water (base flow) samples are collected twice annually at each spring complex. The Comal Springs complex has five sample locations along the Comal system from the upstream end of Landa Lake (where Blieders Creek empties into the headwaters of Landa Lake) to the south end of the Comal River, upstream of the confluence with the Guadalupe River. In the San Marcos system, surface water samples are collected at seven locations. Sample sites begin at Sink Creek upstream of the headwaters of Spring Lake on the north end of the system and end downstream of Capes Dam on the south end of the system.

Surface water sample locations are designed to provide water quality data for the majority of the surface waters of each spring system and river reach of concern. Sample sites in each system are located upstream and downstream of springflow or other potential surface water inputs (such as Dry Comal Creek or Purgatory Creek). Surface water samples are analyzed for a broad spectrum of parameters as outlined in Table 1. Surface water samples were collected in March and September 2016.

Regulatory standards for surface water quality vary depending upon type of use. For this report, surface water (base flow) results are compared to drinking water quality standards (30 Texas Administrative Code [TAC] Chapter 290, Subchapter F) for detected constituents of concern. These guidelines were selected for use since in general they provide the most stringent quality standards. For detections of interest that do not have an established maximum contaminant level (MCL) under 30 TAC 290, the Texas Risk Reduction Program (TRRP) from 30 TAC 350 was substituted. The TRRP standards used are the Tier I, residential standards and are referred to as protective concentration levels (PCLs). Pharmaceutical and Personal Care Products (PPCP) including caffeine can be chemicals of concern because they can indicate the presence of contamination from anthropogenic sources including wastewater discharge (U.S. Environmental Protection Agency [EPA] 2012). Currently, there are no regulatory standards to compare caffeine detections against, but results are listed in this report to provide an indication of potential anthropogenic impacts. Additionally, bacteriological results were compared with Texas Surface Water Quality Standards for primary recreational waters (30 TAC 307.7). The 30 TAC 307.7 standards are typically applied to waters affected by anthropogenic sources and are used here solely to provide a reference level for bacterial counts. Other guidelines may be more useful or appropriate for particular research; however, for the scope of this report these standards provide an appropriate and applicable guideline with regard to water quality.

**Table 1. Listing of Analytical Parameters by Sample Type**

Analytical Parameter	Surface Water (Base Flow) Samples	Stormwater Samples	Sediment Samples	PDS
Volatile Organic Compounds (VOCs)	Yes	Yes	Yes	Yes*
Semi-volatile Organic Compounds (SVOCs)	Yes	Yes	Yes	Yes*
Organochlorine Pesticides	Yes	Yes	Yes	Yes*
Polychlorinated Biphenyls (PCBs)	Yes	Yes	Yes	No
Organophosphorous Pesticides	Yes	Yes	Yes	No
Herbicides	Yes	Yes	Yes	No
Metals (Al, Sb, As, Ba, Be, Cd, Cr [total], Cu, Fe, Pb, Mn, Hg, Ni, Se, Ag, Tl, and Zn)	Yes	Yes	Yes	No
General water quality parameters (GWQP), total alkalinity (as CaCO <sub>3</sub> ), bicarbonate alkalinity (as CaCO <sub>3</sub> ), carbonate alkalinity (as CaCO <sub>3</sub> ); Cl, Br, NO <sub>3</sub> , SO <sub>4</sub> , F, pH, total dissolved solids (TDS), total suspended solids (TSS), Ca, Mg, Na, K, Si, Sr, CO <sub>3</sub> ,	Yes	Yes	No TDS or TSS	No
Phosphorus (total)	Yes	Yes	Yes	No
Total Organic Carbon (TOC),	Yes	Yes	Yes	No
Dissolved Organic Carbon (DOC)	Yes	Yes	No	No
Total Kjeldahl Nitrogen (TKN)	Yes	Yes	No	No
Bacteria (E. coli)	Yes	Yes	No	No
Field Parameters (DO, pH, Conductivity, Turbidity, Temperature)	Yes	Yes	No	No
Caffeine	Yes	Yes	No	No

\* Passive diffusion samplers (PDS) samplers are analyzed for a modified set of VOCs, SVOCs, and organochlorine pesticides

**Figure 2. EAHCP expanded water quality monitoring program, San Marcos Springs and River.**

## **1.2     Sediment Samples**

Collection of sediment samples within each spring system was included in the program to help ascertain potential effects on listed species via direct or indirect exposure to sediments. Designated sediment sample locations were coincident with surface water (base flow) sample locations at each spring complex. Specifically, five sediment samples were collected from the Comal Springs area and seven locations were sampled within the San Marcos area. In the first two years of the program, sediment samples were collected from the sediment surface to approximately 18 inches below the surface. The EAHCP Work Plan reduced the sampling depth to three inches below the surface beginning in 2015. Samples were analyzed for the parameters listed in Table 1.

SWCA collected sediment samples as close to each associated surface water sample location as possible. However, for some of the samples, collection points were moved slightly to find adequate sediment or to avoid rocky substrates that prevented collection of adequate sample volume. Appendix C of this report discusses sample locations where any significant deviations from this approach occurred.

Analytical results for sediment samples are compared to the sediment quality guidelines published in *Development and Evaluation of Consensus-Based Sediment Quality Guidelines for Freshwater Ecosystems* (MacDonald, Ingersoll, and Berger 2000). These guidelines are based on determination of probable sediment toxicity in freshwater ecosystems and provide a numerical sediment quality guideline for 28 chemicals of concern. The guidance provides two basic standards for comparison: 1) threshold effect concentration (TEC), and 2) probable effect concentration (PEC). Analytical results with a concentration below the TEC are predicted to be non-toxic (on sediment-dwelling organisms), whereas results with a concentration above the PEC are indicated as having a probable toxic effect on sediment-dwelling organisms. Detected compounds with concentrations between the TEC and PEC are considered equally likely to be toxic or non-toxic. Additional guidelines for chemicals of concern that were not included in MacDonald et al. (2000) were taken from *Conducting Ecological Risk Assessments at Remediation Sites in Texas* developed by the Texas Commission on Environmental Quality ([TCEQ] 2014a) and *Guidance for Assessing and Reporting Surface Water Quality in Texas* (TCEQ 2012). While numerous other guidelines for sediment quality exist, these guidelines provide a good reference for the scope of the current investigation. Future researchers may find other guidelines more specific to particular concerns or interests.

## **1.3     Stormwater Samples**

SWCA conducted stormwater sampling at five Comal Springs locations and at seven San Marcos Springs locations. The EAA adopted stormwater sample collection as part of the expanded water quality monitoring effort to assess potential contaminants that may be present in surface water runoff generated by storm events. The stormwater sampling effort was designed to assess what changes in water quality occur within each surface water system during a storm event. SWCA collected storm samples in association with various surface water inputs along each spring complex within the study area. Appendix C of this report discusses details of each stormwater sample location and any deviations from the EAHCP Work Plan. Stormwater samples were analyzed for the same parameters as surface water (base flow) samples as outlined in Table 1.

SWCA collected stormwater samples at three points across the storm hydrograph for each stormwater sampling site. Sample collection was targeted for the rising limb, peak, and receding limb of the storm hydrograph. Timing for sample collection was generally determined using the RTI system's conductivity

and turbidity parameters rather than the flow measurements from the USGS streamflow gauges. The USGS gauges are only updated on an hourly basis, whereas data from the RTIs was available on 15-minute intervals and provided more timely information. Automated sample collection equipment was not utilized for stormwater sample collection due to sample volume, preservation, and analysis limitations. Therefore, sampling was conducted manually. Each spring group was sampled twice for stormwater events during calendar year 2016 per the EAHCP Work Plan.

As previously mentioned, standards for surface water quality vary dependent upon type of use. For this report, stormwater results are compared to drinking water quality standards (30 TAC 290, Subchapter F) for detected chemicals of concern. These guidelines were selected for use since, in general, they provide the most stringent quality standards. For detections of interest that do not have an established MCL under 30 TAC 290, the TRRP PCLs from 30 TAC 350 were substituted. The TRRP standards used are the Tier I, residential standards. Currently, there are no regulatory standards to compare caffeine detections against, but results are listed in this report to provide an indication of anthropogenic contamination. Bacterial counts were compared with Texas Surface Water Quality Standards (30 TAC 307). Other guidelines may be more useful or appropriate for particular research; however, for the scope of this report these standards provide an appropriate and applicable guideline with regard to water quality.

#### **1.4 Surface Water Passive Sampling**

SWCA deployed Amplified Geochemical Imaging (AGI) LLC, PDSs in both spring complexes to measure trace organic constituents. Samplers consisted of a sorbent solid phase material that concentrates compounds from the environment. Following collection, the analytes of interest were eluted and analyzed by gas chromatography coupled with a mass spectrometry detector (GC-MS). The increased contact time associated with long-term deployment of the collection material allowed the analytes to be greatly concentrated beyond what is typically found in water samples. Therefore, the PDS provides greater sensitivity to trace level constituents. Analyzed parameters can be found in Table 1.

SWCA deployed PDSs to each of the 12 sample sites for two-week periods in February, April, June, August, October, and December 2016. Sample points coincided with surface water collection points unless prevented by field conditions, and any alterations are discussed in Appendix C.

#### **2.0 SAMPLE LOCATION DETAIL**

Details of individual sample locations are provided in the following figures. Figures 3–6 show sample location details for the Comal Springs area. Figures 7–10 provide sample location details for the San Marcos Springs area.

**Figure 3. EAHCP Comal Springs detailed map indicating sample locations 110, 210, 310, 410, 120, 320 and 420.**

**Figure 10. EAHCP San Marcos Springs detailed indicating map sample locations 160, 260, 360, 460, 170, 270, 370 and 470.**

### **3.0 MODIFICATIONS OF ACTIVITIES DUE TO DROUGHT**

Sampling activities were impacted by the sporadic occurrence of qualifying rainfall events within the project area. Significant rainfall occurred during the first half of 2016. Rainfall for the year was average, however, rainfall was very sparse from July through much of October. Rain events in the second half of 2016 were generally scattered in nature and often too small in magnitude to generate sufficient runoff to sample.

Also, due to abundant rainfall in the spring of 2016, flow rates did not drop below 30 cfs at Comal Springs, or below 50 cfs at San Marcos Springs. No extreme low-flow sampling was initiated at water wells (Sections 6.4.3.3 and 6.4.4.3 of the EAHCP).

### **4.0 AFFECT ON COVERED SPECIES**

The implementation of the EAHCP water quality and sediment sampling program provided baseline data along the Comal River and upper reaches of the San Marcos River system. SWCA collected water quality grab samples twice from each river during base flow conditions and during two storm events. SWCA also collected sediment samples from both systems. PDSs were used to evaluate trace organic compounds six times throughout the year.

The collection and analysis of water quality and sediment samples aids evaluation of the habitat of species by providing base flow, storm flow, and sediment quality data. The data included water quality discharging directly from the springs and water discharging into the Comal and San Marcos Rivers below the springs.

In Section 7, analytical results are compared to various water quality and sediment standards as guidelines to identify any existing problems and create a body of baseline data to ascertain any long-term sediment and water quality trends. These trends can then be compared to trends in biologic survey data that is also being collected as part of the EAHCP.

### **5.0 LOGISTICS**

To accommodate the needs of the EAHCP's expanded water quality monitoring program, a significant amount of resources are required. These resources, including sampling equipment, safety gear, trained staff, and sampling schedules, are all key components to the program. Additionally, the development of sampling strategies and planning of each sampling event are required to insure that resources are used efficiently, and collection is completed within the scheduled time frame. The strategies must account for the unpredictable nature of storm events. Below is a short synopsis of events and tasks undertaken to accomplish the necessary logistics for the EAHCP sampling program.

#### **5.1 Surface Water (Base Flow) Sampling Program**

Prior to each sampling event, SWCA staff acquired necessary supplies and equipment including laboratory sample kits, disposable bailers, and 0.45-micron filters.

## **5.2 Sediment Sampling Program**

SWCA acquired sediment sampling equipment in 2014 and 2015, and purchased an additional core sampler extension handle in 2016 to accommodate sampling at site HCS330, because the water depth was greater than in previous years. In May 2016, SWCA staff acquired sample containers from the contract laboratory.

## **5.3 Stormwater Program**

Prior to each sampling event, SWCA acquired laboratory sample kits and prepared them for use in the field. All other sampling and safety supplies were kept stocked and ready for mobilization in the event a storm occurred. SWCA monitored weather forecasts on a regular basis to determine if teams would be mobilized for a potential sampling event. Prior to mobilization, many logistical concerns have to be addressed including, but not limited to, personnel availability, safety, staging area reservation, vehicle availability, sonde rental, and laboratory notifications.

## **5.4 Surface Water Passive Sampling Program**

SWCA acquired PDS from the contract laboratory approximately two weeks prior to each sampling event. SWCA constructed sample deployment devices in 2014, and constructed additional deployment devices in 2016 to replace devices lost or damaged in the field. Prior to each deployment, SWCA decontaminated the devices and placed them inside clean plastic bags.

## **6.0 SAMPLE COLLECTION METHODOLOGY**

### **6.1 Surface Water (Base Flow) Sampling Program**

SWCA collected surface water quality (base flow) grab samples from five sites throughout the Comal Springs complex and seven sites throughout the San Marcos Springs complex, biannually. According to the EAHCP Work Plan, the sample dates were to be six months apart. The preferred method for obtaining a surface water sample is to reach the sampling location from the shoreline or wade to the sample location, obtain field parameters (pH, specific conductivity, dissolved oxygen, and temperature) and then insert the sample bottle directly into the water or use a sample bottle and pole assembly. SWCA collected samples directly within sample bottles as opposed to using a pole assembly. For samples collected while wading, SWCA collected the samples on the upstream side of the sampler. SWCA collected samples in accordance with the criteria set forth in the *EAA Groundwater Quality Monitoring Plan*.

Filtration for methods 6010B (metals), 6020 (metals), 7470A (mercury), 960 (dissolved organic carbon, DOC) and field alkalinity were performed at the sample location by using a 0.45-micron high capacity cartridge filter attached to a single-sample disposable bailer. Preservatives were placed in the bottles (as appropriate) by the contracted laboratory. Samples were placed in coolers with ice immediately upon collection. Samples were later picked up by the contract laboratory. When not in use or after collection, sampling equipment and/or coolers containing samples were secured inside the SWCA vehicles to maintain appropriate sample custody and security.

The *EAA Groundwater Quality Monitoring Plan* required the collection of one field duplicate sample for each spring complex per sampling event. SWCA sampled the field duplicate immediately after the parent water quality sample and in the same manner as the parent water quality sample.

Analyses for field alkalinity were conducted at SWCA's San Antonio office. The method used for field alkalinity is discussed in detail in the *EAA Groundwater Quality Monitoring Plan* (Appendix D). Field alkalinity analysis was performed within 8 hours of sample collection. Any deviations from this hold time are discussed in Appendix C. Representative photographs of field activities are included in Appendix E.

## **6.2 Sediment Sampling Program**

SWCA collected sediment samples once annually from the first three inches of sediment below the streambed surface at each of the 12 sampling locations. Sediment sample collection points generally coincided with the surface water collection points at each of the 12 sample locations in the spring complexes, but varied slightly based on field conditions. Based on the amount of available sediment at each site, the location and area sampled varied. Sample collection location variations are discussed in Appendix C. Sediment sample collection methods were consistent with the guidelines established in the *EAA Groundwater Quality Monitoring Plan*. SWCA collected the majority of samples using stainless steel hand trowels. The trowel was inserted into the sediment three inches, and the sample was scooped into sample containers provided by the contract laboratory. SWCA collected one one-liter jar and one two-ounce jar for volatile organic compound (VOC) analysis at each location. Samples were composed of sediment collected at three locations at each sample point, which was combined and homogenized at the contract laboratory prior to analysis. The water depth at HCS330 made it impossible to collect a sample using hand trowels; instead SWCA collected the sample using a hand core sampler consisting of a two-inch-diameter, 20-inch-long stainless steel barrel with a plastic tube liner. SWCA extruded the samples from the sample tube and into the sample containers.

In compliance with the *EAA Groundwater Quality Monitoring Plan* and consistent with the EAA practices of 2013, SWCA collected two field duplicates and two equipment blanks. One field duplicate sample is required for each spring complex. SWCA collected the field duplicates at the same locations as two of the field samples, using the same methods as the field samples. Two equipment blanks were prepared in the laboratory of SWCA's San Antonio office. To collect one of the blanks, American Society for Testing and Materials (ASTM) Type II Reagent Grade water was poured through a new plastic sampling tube into sample collection containers. SWCA collected the second equipment blank by pouring ASTM Type II Reagent Grade water over a decontaminated trowel into sample collection containers. The samples were containerized in the same manner as a surface water sample using the same types of containers and preservatives. Sample portions for metals analyses requiring field filtration were filtered using a 0.45-micron high capacity cartridge filter and disposable bailer. The equipment blanks were not analyzed for the following analytes: field parameters, turbidity, field alkalinity, and bacteria.

All samples were labeled and put on ice immediately upon collection for later shipment to the contract laboratory. Samples were secured inside locked SWCA vehicles during field operations and appropriate custody was maintained at all times. Representative photographs of field activities are included in Appendix E.

## **6.3 Stormwater Sampling Program**

Stormwater samples are designated by the EAHCP Work Plan (Appendix A) for collection twice annually from each spring complex. SWCA collected stormwater samples when rainfall amounts were adequate to initiate at least a 5% rise at the respective USGS gauging locations for each spring complex. SWCA

collected samples across the storm-affected stream hydrograph at the rise, peak, and recession limb of the associated stream hydrograph. As with the other sample types, SWCA sampled five locations at Comal Springs and seven locations at San Marcos Springs. In general, the turbidity and conductivity data from the RTIs at each site were used as a surrogate for the stream hydrograph due to immediate availability of the data. Stream hydrograph data is only updated hourly on the USGS website. The RTI data is updated every 15 minutes, which provides greater resolution regarding the effect of the storm event on the streams and facilitates quicker sampling response times. Graphs showing water quality parameters during each storm event are included in Appendix B.

Stormwater sample collection was affected by the ongoing dry conditions across the region during the second half of 2016. Often, storms that materialized were insufficient to create adequate runoff for sample collection. In general, when rainfall probabilities exceeded 20% for a given time period, the team was placed on-call for sample collection. The team was mobilized when rainfall probabilities of at least 0.5 inch exceeded 50%. Storm team duty is summarized and documented in Appendix F of this document.

Due to the inherently unsafe conditions associated with stormwater flow, SWCA field staff used disposable single-use bailers when needed in order to safely obtain water samples during stormwater sampling events. Field parameters were collected first by inserting the sonde probe as close to the sample location as possible. In March and November 2016, SWCA sampled location HSM240 using disposable bailers. SWCA staff lowered bailers from the bridge above the sample location and used a rope affixed to the bailer for retrieval. SWCA used new bailers and rope for each sample point. After retrieval, SWCA staff transferred the water to the sample containers. SWCA used only new, disposable equipment for stormwater sampling events.

Stormwater sampling efforts conformed to the protocols outlined in the *EAA Groundwater Quality Monitoring Plan* for sample collection, handling, and decontamination. Filtration for methods 6010B (metals), 6020 (metals), DOC and field alkalinity were performed using a 0.45-micron high capacity cartridge filter and peristaltic pump. Preservatives were placed in the bottles (as needed) by the contract laboratory prior to sample collection. SWCA immediately placed all samples into coolers with ice and later shipped samples to the contract laboratory. When not in use or after collection, sampling equipment and/or coolers containing samples were secured inside locked SWCA vehicles to maintain appropriate sample custody and security.

According to the *EAA Groundwater Quality Monitoring Plan*, SWCA collected two field duplicates for the Comal Springs complex and three for the San Marcos Springs complex per rain event. SWCA sampled field duplicates after collection of the parent sample and in the same manner as the field sample. No equipment blanks were required for stormwater samples as all equipment used was new and disposable.

Analyses for field alkalinity were performed at the field staging area or at SWCA's San Antonio office. The method used for field alkalinity is discussed in detail in the *EAA Groundwater Quality Monitoring Plan*. Representative photographs of field activities are included in Appendix E.

#### **6.4 Surface Water Passive Samplers**

SWCA deployed the PDSs at each of the 12 sample locations during the months of February, April, June, August, October, and December 2016. In general, PDS locations corresponded to surface water sampling

points unless prevented by field conditions. Lost PDSs, human tampering, and any variations in deployment locations are discussed in Appendix C.

SWCA staff constructed deployment devices at SWCA's San Antonio office in June 2014. Two-inch thick, 18-inch diameter concrete disks were poured and a stainless steel silverware cup was set approximately one inch deep in the center of the disk. Handles were formed by inserting both ends of an 18-inch length of vinyl-coated stainless steel cable into each side of the disk. Site numbers were marked in the wet concrete to dedicate each device to a sample location. The concrete was allowed to cure, and each device was decontaminated following the *EAA Groundwater Quality Monitoring Plan* guidelines and placed in a clean plastic bag prior to the first deployment. The same decontamination procedures were followed for subsequent sampling events. SWCA constructed additional deployment devices in 2016 to replace devices lost or damaged in the field. The deployment device is pictured in Figure 11.

Upon arrival at the sample location, the PDS was removed from a dedicated vial and affixed inside of a second stainless steel silverware cup with a plastic cable tie. This cup was inverted and placed on top of the cup set in the concrete sampling device enclosing the PDS inside the two cups. The two cups were secured to one another with additional plastic cable ties. The device was then gently lowered into the water. Installation date and time and PDS identification numbers were noted in the field notebook and on the PDS vial. To retrieve the PDS, the devices were simply removed from the water and the cable ties cut. The PDS was then immediately placed back in the dedicated vial and retrieval date and time were notated. Deployment devices were secured at SWCA offices when PDSs were not deployed.

SWCA collected field duplicates as directed by the *EAA Groundwater Quality Monitoring Plan*. To collect field duplicates, a second PDS was installed inside selected deployment devices. Field PDSs were always accompanied by test blank samplers to monitor for VOC contamination. Deployment devices were dedicated to each sample location to avoid cross contamination and were decontaminated following the *EAA Groundwater Quality Monitoring Plan* guidelines prior to each use. Representative photographs of field activities are included in Appendix E.

**Figure 11. PDS deployment device prior to installation at site HSM440.**

## **7.0 SAMPLE RESULTS**

Results from the sampling efforts related to the EAHCP sampling program are discussed in the paragraphs that follow. Results are discussed by sample type for Comal Springs, followed by a separate discussion by sample type for San Marcos Springs. Sample events are listed in the order of surface water (base flow) samples, sediment samples, stormwater samples, and PDS. Laboratory analyses and field parameters are provided in Appendix G of this document. The laboratory data were reviewed by SWCA staff with the results of that review provided as Appendix H (data validation discussion) of this document. Each sample location (latitude/longitude), name, and other location information are also summarized in Appendix I of this document.

### **7.1 Comal Springs Sample Results**

SWCA sampled the Comal Springs complex for water quality during surface water (base flow) conditions in March and September 2016. In general, few detections were noted. As discussed previously, surface water (base flow) samples are compared to the drinking water standards for water quality in this report.

Sediments at the Comal Springs complex were sampled in June 2016. Sediment results are compared to the standards developed by McDonald et al. (2000) and TCEQ (2012, 2014a). These standards are based on the probability that a detected compound has a toxic effect on sediment-dwelling organisms and are referred to as the TEC and PEC. Detections below the TEC are not considered to be toxic, whereas detections above

the PEC are considered to be toxic to sediment dwelling organisms. Detections above the TEC but less than the PEC are considered equally likely to be toxic or non-toxic.

Stormwater events were sampled at the Comal Springs complex in April and September 2016. Stormwater results did not indicate a significant number of detections of concern.

PDS sampling events were conducted at the Comal Springs complex in February, April, June, August, October and December 2016. Generally speaking, various VOCs and total petroleum hydrocarbons (TPH) were detected at various sample locations, but only tetrachloroethene was consistently detected.

### 7.1.1 Comal Springs Surface Water / Base Flow Sampling

SWCA sampled the Comal Springs complex on March 2 and September 8, 2016, for surface water (base flow) events.

#### 7.1.1.1 Surface Water / Base Flow - Bacteria

Bacteria results for surface water (base flow) associated with the Comal Springs complex ranged from 11 MPN/100 mL (most probable number of colony-forming units per 100 milliliters of water) to 100 MPN/100 mL for *Escherichia coli* (*E. coli*). Because of the presence of various fauna in surface water collection sites, positive detections are not uncommon. The 2014 Texas Surface Water Quality Standard for *E. coli* in primary recreation waters is a geometric mean of 126 MPN/100 mL with no individual sample exceeding 399 MPN/100 mL (30 TAC 307.7). The geometric mean for surface water samples collected from the Comal Springs complex during 2016 was approximately 38 MPN/100 mL. Surface water (base flow) bacteria counts are summarized in Table 2.

**Table 2. Surface Water Samples – Bacteria Counts  
- Comal Springs Complex**

Location	Date	Count (MPN/100 mL)
HCS110	3/2/2016	100
	9/8/2016	96
HCS120	3/2/2016	21
	9/8/2016	25
FDHCS120	3/2/2016	11
	9/8/2016	26
HCS130	3/2/2016	13
	9/8/2016	75
HCS140	3/2/2016	41
	9/8/2016	71
HCS160	3/2/2016	46
	9/8/2016	48

MPN/100 mL – Most probable number per 100 milliliters of water.

### 7.1.1.2 Surface Water / Base Flow - Volatile Organic Compounds (VOCs)

No VOCs were detected at any of the five sampling sites from the Comal Springs complex during the March or September 2016 sampling events.

### 7.1.1.3 Surface Water / Base Flow - Semi-volatile Organic Compounds (SVOCs)

Generally, semi-volatile organic compounds (SVOCs) were analyzed because their detection can indicate the presence of chemicals originating from anthropogenic sources and therefore be used to evaluate potential impacts on water quality. Two SVOCs were detected in the Comal Springs complex during the September 2016 sampling events. Bis(2-Ethylhexyl) phthalate (DEHP) and di-n-butyl phthalate were each detected in two samples. The detections were “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. DEHP was detected in sample HCS160 at 10.1 J µg/L, exceeding the PCL of 6 µg/L in September 2016. SVOC detections are summarized below in Table 3. DEHP detections are shown further in Figure 12.

**Table 3. Surface Water Samples – Semi-volatile organic compound detections - Comal Springs Complex**

Location	Date Collected	Bis(2-Ethylhexyl) Phthalate (µg/L)	Di-n-Butyl Phthalate (µg/L)
HCS110	3/2/2016	<5.00	<0.709
	9/8/2016	5.52 J	<0.709
HCS140	3/2/2016	<5.00	<0.709
	9/8/2016	<5.00	2.20 J
HCS160	3/2/2016	<5.00	<0.709
	9/8/2016	10.1 J	2.48 J
MCL		NE	NE
PCL		6	2400

J – Detection is greater than the method detection limit, but less than the reporting limit

MCL – maximum contaminant level

NE – Not established

PCL – protective concentration levels

µg/L – micrograms per liter

**Figure 12. Bis(2-Ethylhexyl) phthalate (DEHP) in Comal Springs Complex Surface Water Samples Compared to the Protective Concentration Level (PCL)**

#### **7.1.1.4 Surface Water / Base Flow - Pesticides**

Surface water samples were analyzed for pesticides because their detection can indicate the presence of chemicals originating from anthropogenic sources; and therefore, can be used to evaluate potential impacts on water quality. No pesticides were detected in any of the samples collected for the March or September 2016 sampling events at all five sites for the Comal Springs complex. Due to an error at the laboratory, organophosphorus pesticide samples originally collected on September 9, 2016, had to be recollected on October 24, 2016. This deviation is discussed in more detail in Appendix C.

#### **7.1.1.5 Surface Water / Base Flow - Herbicides**

Surface water samples were analyzed for herbicides because their detection can indicate the presence of chemicals originating from anthropogenic sources; and therefore, can be used to evaluate potential impacts on water quality. Herbicide analyses indicated no detections for both the March and September 2016 sampling events at all five sites for the Comal Springs complex.

#### **7.1.1.6 Surface Water / Base Flow - Polychlorinated Biphenyls (PCBs)**

Surface water samples were analyzed for the various Aroclor compounds that are collectively referred to as Polychlorinated Biphenyls (PCBs). PCB detection can indicate the presence of chemicals originating from anthropogenic sources; and therefore, can be used to evaluate potential impacts on water quality. No PCBs were detected during both the March and September 2016 sampling events at all five sites for the Comal Springs complex.

### 7.1.1.7 Surface Water / Base flow - Metals

Surface water samples were analyzed for metals that may indicate the presence of chemicals originating from anthropogenic sources. Although metals were detected for the March and September 2016 sampling events at all five sites for the Comal Springs complex, no metals were detected at a concentration in excess of the drinking water standards. The metals arsenic, barium, lead, mercury, and selenium were the detected metals of concern; however, none of their concentrations approached the MCL or PCL. These detections are listed below in Table 4. Note that many of the detections are “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. Also note that some metals are naturally occurring in rock, soil, groundwater, and surface water and may not indicate an anthropogenic source.

**Table 4. Surface Water Samples – Metal detections - Comal Springs Complex**

Location	Date Collected	Arsenic (mg/L)	Barium (mg/L)	Lead (mg/L)	Mercury (mg/L)	Selenium (mg/L)
HCS110	3/2/2016	0.00161 J	0.0464	<0.000733	<0.000130	0.00157 J
	9/8/2016	<0.00109	0.0601	<0.000733	<0.000130	<0.00108
HCS120	3/2/2016	<0.00109	0.0445	<0.000733	<0.000130	<0.00108
	9/8/2016	<0.00109	0.0561	<0.000733	<0.000130	<0.00108
FDHCS120	3/2/2016	<0.00109	0.0445	0.00179 J	<0.000130	<0.00108
	9/8/2016	<0.00109	0.0588	<0.000733	<0.000130	<0.00108
HCS130	3/2/2016	<0.00109	0.0439	<0.000733	<0.000130	0.00153 J
	9/8/2016	<0.00109	0.0547	<0.000733	<0.000130	<0.00108
HCS140	3/2/2016	<0.00109	0.0425	<0.000733	<0.000130	0.00108 J
	9/8/2016	<0.00109	0.0578	<0.000733	<0.000130	<0.00108
HCS160	3/2/2016	<0.00109	0.0435	<0.000733	<0.000130	<0.00108
	9/8/2016	<0.00109	0.0578	<0.000733	0.000302 J	<0.00108
MCL		0.01	2	NE	0.002	0.05
PCL		--	--	0.015	--	--

-- - Not applicable

J – Detection is greater than the method detection limit, but less than the reporting limit

MCL – maximum contaminant level

mg/L – milligrams per liter

NE – Not established

PCL – protective concentration levels

### 7.1.1.8 Surface Water / Base Flow - Nitrates

Surface water samples were analyzed for nitrate-nitrite as nitrogen. Laboratory analyses indicated a limited range of nitrate-nitrite as nitrogen in surface water samples. Of the 12 surface water samples (ten environmental samples and two field duplicates) collected for the two sample events, concentrations ranged from 1.23 milligrams per liter (mg/L) to 1.92 mg/L. None of the nitrate concentrations detected exceeded

the MCL of 10 mg/L for drinking water. The highest nitrate concentration in surface water at the Comal Springs complex, 1.92 mg/L, was detected at HCS130 on September 8, 2016. Nitrate-nitrogen results are summarized in Table 5.

**Table 5. Surface Water Samples – Nitrate Detections - Comal Springs Complex**

Location	Date	Concentration (mg/L)
HCS110	3/2/2016	1.23
	9/8/2016	1.53
HCS120	3/2/2016	1.79
	9/8/2016	1.86
FDHCS120	3/2/2016	1.78
	9/8/2016	1.87
HCS130	3/2/2016	1.84
	9/8/2016	1.92
HCS140	3/2/2016	1.76
	9/8/2016	1.83
HCS160	3/2/2016	1.79
	9/8/2016	1.87
MCL		10

MCL – maximum contaminant level

mg/L – milligrams per liter

#### **7.1.1.9 Surface Water / Base Flow – Caffeine**

Surface water base flows were analyzed for caffeine, which can indicate an anthropogenic source. Caffeine may enter surface water from leaking sewer or septic systems or it may be present in the aquifer from similar sources in the recharge zone (EPA 2012). Potential ecological effects are currently unknown but could include reduced reproductive success in aquatic species (EPA 2012). Caffeine detections in surface water (base flow) samples from Comal Springs in March 2016 ranged from 2.6 to 15 nanograms per liter (ng/L). Caffeine was only detected at three surface water locations in the Comal Springs system, HCS110, HCS120 and HCS130. There is no regulatory standard or expected value for comparison. Results are shown in Table 6.

**Table 6. Surface Water Samples – Caffeine Detections - Comal Springs Complex**

Location	Date Collected	Caffeine (ng/L)
HCS110	3/2/2016	5.3
	9/8/2016	<0.31
HCS120	3/2/2016	2.6
	9/8/2016	<0.31
FDHCS120	3/2/2016	3.8
	9/8/2016	15
HCS130	3/2/2016	7.8
	9/8/2016	15
HCS140	3/2/2016	<0.31
	9/8/2016	<0.31
HCS160	3/2/2016	<0.31
	9/8/2016	<0.31

ng/L – nanograms per liter

## 7.1.2 Comal Springs Sediment Sampling

### 7.1.2.1 Sediment - Volatile Organic Compounds (VOCs)

Four VOC compounds were detected in sediment samples collected in the Comal Springs system in 2016. All VOC detections are “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. None of the VOCs detected have established TEC or PEC values. The detections are summarized below in Table 7.

**Table 7. Sediment Samples – Volatile Organic Compound Detections - Comal Springs Complex**

Location	Date Collected	Acetone (µg/kg)	2-Butanone (µg/kg)	4-Isopropyltoluene (µg/kg)	Styrene (µg/kg)
HCS310	6/8/2016	64.4 J	<15.5	<3.21	<2.44
HCS320	6/8/2016	43.1 J	7.38 J	<0.671	<0.510
HCS330	6/8/2016	9.15 J	<2.14	<0.445	0.641 J
HCS340	6/8/2016	41.2 J	8.68 J	<0.584	<0.444
HCS360	6/8/2016	199 J	<20.5	<4.26	<3.24
FDHCS360	6/8/2016	224 J	38.7 J	46.3 J	<3.32
TEC		NE	NE	NE	NE
PEC		NE	NE	NE	NE

J – Detection is greater than the method detection limit, but less than the reporting limit

µg/kg – micrograms per kilograms

NE – not established

PEC – probable effect concentration

TEC – threshold effect concentration

#### **7.1.2.2 Sediment - Semi-volatile Organic Compounds (SVOCs)**

Several SVOC compounds were detected in the sediment samples collected in the Comal Springs system in 2016. Many of these detections are “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. DEHP was detected in all Comal Springs sediment samples in 2016. Sediment samples from HCS320 and HCS340 also contained 3- and 4-methylphenol. The remaining detections were polycyclic aromatic hydrocarbons (PAH) compounds.

The SVOC detections are summarized below in Table 8. PAH compounds exceeding the TEC are shown graphically in Figures 13–17. Total PAH detections are shown in Figure 18, where the total PAH concentrations (sum of all detected concentrations for each sample point) are compared to the TEC and PEC values for total PAH concentration established by MacDonald et al. (2000). Samples HCS360 and FDHCS360 exceed the TEC for total PAH concentrations and five individual PAH compounds.

**Table 8. Sediment Samples – Semi-volatile Organic Compound Detections - Comal Springs Complex**

Location	Date Collected	PAH Compounds											Non-PAH Compounds	
		Benzo (a) anthracene	Benzo (a) pyrene	Benzo (b) fluoranthene	Benzo (g,h,i) perylene	Benzo (k) fluoranthene	Chrysene	Fluoranthene	Indeno (1,2,3-cd) pyrene	Phenanthrene	Pyrene	TOTAL PAH	Bis(2-ethylhexyl) phthalate	3 and 4-Methylphenol
		(mg/kg)	(mg/kg)	(mg/kg)	(mg/kg)	(mg/kg)	(mg/kg)	(mg/kg)	(mg/kg)	(mg/kg)	(mg/kg)	(mg/kg)	(mg/kg)	(mg/kg)

### ***7.1.2.3 Sediment – Pesticides***

Sediment samples were analyzed for both organochlorine and organophosphorus pesticides. No pesticides were detected in any of the sediment samples collected in the Comal Springs complex.

### ***7.1.2.4 Sediment – Herbicides***

Sediments were analyzed for herbicide compounds to further assess sediment quality at the Comal Springs complex. Herbicide compounds were detected in two sediment samples collected from the Comal Springs complex. Dalapon was detected at a concentration of 9.72 J µg/kg at HCS320. Another herbicide compound, 2,4-D, was detected in FDHCS360 at a concentration of 5.05 J µg/kg. Both of these detections are “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. There are no TEC or PECs established for these compounds.

### ***7.1.2.5 Sediment – Polychlorinated Biphenyls***

Sediments were analyzed for PCB compounds to further assess sediment quality at the Comal Springs complex. There was one PCB detection in the sediment samples collected from the Comal Springs complex in 2016. Aroclor 1262 was detected in HCS340 at a concentration of 16.5 J µg/kg. This detection is “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. The detection does not exceed the total PCB TEC of 59.8 µg/kg or PEC of 676 µg/kg.

### ***7.1.2.6 Sediment – Metals***

Many metals are naturally occurring within soil, rock, and sediment. Sediment sample results for the Comal Springs complex tested positive for several metals, generally at low concentrations. Metals detected above the method detection limit and subsequently evaluated in this report for potential toxic effects using the TEC and/or PEC standards are: arsenic, cadmium, chromium, copper, lead, mercury, nickel, and zinc. Other metals detected that do not have a TEC or PEC value available were compared to Texas-specific background concentrations (TSBC) (TCEQ 2014b) for soil. These metals are aluminum, antimony, barium, beryllium, iron, manganese, and selenium. None of the metals detected exceeded TEC or PEC values. Only two metals without PECs, antimony and selenium, exceeded the TSBC.

For the evaluation of antimony levels TCEQ recommends an Effects Range Low (ERL) of 2 mg/kg (TCEQ 2014a) and an Effects Range Median (ERM) of 25 mg/kg (TCEQ 2012). Antimony detections were “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. Antimony was detected at HCS310 at 2.00 J mg/kg, meeting but not exceed the ERL.

Sediment studies of selenium concentrations have shown that levels below 4 mg/kg are not likely to bioaccumulate in the food chain or have adverse impacts on the reproduction of fish or aquatic birds (Lemly 1995; Moore et al. 1990; Van Derveer and Canton 1996). Selenium detections did not exceed this amount in the sediment samples from the Comal Springs complex in 2016.

Metal detections are listed in Table 9. Antimony and selenium detections are displayed graphically in Figures 19 and 20.

**Figure 19. Antimony in Comal Springs Complex Sediments Compared to Texas-Specific Background Concentration (TSBC) and Effects Range Low (ERL)**

PEC – probable effect concentration

TEC – threshold effect concentration

TSBC – Texas-specific background concentrations

### 7.1.3 Comal Springs Stormwater Sampling

Stormwater samples were collected during two storm events at the Comal Springs complex. SWCA sampled the events according to the guidelines in the EAHCP Work Plan. The events occurred on April 12–13, 2016, and September 26–27, 2016. Total rainfall for the April 2016 event was approximately 1.00 to 1.49 inches (National Oceanic and Atmospheric Administration [NOAA] 2016) causing streamflow measured at USGS Gauge 08169000 to increase from approximately 273 cfs to a peak of 376 cfs (USGS 2016). Total rainfall for the September 2016 event was approximately 3.00 to 3.99 inches in the immediate sampling area but reached up to 6.00 inches in areas to the north and west of the sampling area that are within the catchment area of Comal River tributaries (NOAA 2016). Streamflow measurements from the USGS gauge increased from approximately 359 cfs to a peak of 2100 cfs (USGS 2016). Rain fell in the area in the early morning of September 26, 2016, and by 07:30 rain in the immediate area had stopped and water quality began to recover. SWCA collected a set of peak samples at this time when discharge was approximately 538 cfs. After these peak samples were collected, specific conductivity began to fall again and streamflow began to increase but rain had not been falling in the area. SWCA monitored water quality, streamflow and weather radar and prepared to collect another round of peak samples. At HCS250, SWCA staff observed water levels rising and at approximately 12:30, streamflow gradually ceased and then began to flow upstream. It became apparent that flooding in the Guadalupe River was pushing water up the Comal River. EAA was consulted and it was determined that the peak samples collected at 07:30, near 538 cfs, best represented the peak of the storm since the larger peak at 2100 cfs was influenced by the Guadalupe River. SWCA staff returned on September 27, 2016, to collect the trail samples after the Comal River showed more than 50% recovery from the larger 2100 cfs peak.

#### 7.1.3.1 Stormwater – Bacteria Detections

Stormwater samples collected and analyzed for bacteria analyses generally tested positive for high levels of bacteria. Bacterial analyses were performed for *E. coli*, using a most probable number method. The 2014 Texas Surface Water Quality Standard for *E. coli* in primary recreation waters is a geometric mean of 126 MPN/100 mL with no individual sample exceeding 399 MPN/100 mL (30 TAC 307.7). The geometric mean for stormwater samples collected from the Comal Springs complex during April 2016 was approximately 3,999 MPN/100 mL. Bacteria counts from April 2016 ranged from 1,200 MPN/100 mL to 16,000 MPN/100 mL with all samples exceeding the individual sample limit. The geometric mean for stormwater samples collected from the Comal Springs complex during September 2016 was approximately 6,029 MPN/100 mL. Bacteria counts from September 2016 ranged from 1,100 MPN/100 mL to 240,000 MPN/100 mL, with all samples exceeding the individual sample limit. Individual detections are listed below in Table 10 and shown in relation to stream discharge and specific conductivity in Figures 21 and 22. Due to the timing of storm events and laboratory working hours, it was not possible to deliver all samples to the laboratory within sample holding time of 8 hours (see discussion in Appendix C). These samples were included in the range and geometric mean calculations.

**Table 10. Stormwater Samples – Bacteria Counts – Comal Springs Complex**

	9/27/2016	1300

H – Analyzed outside hold time, result included for comparison but not considered valid

MPN/100 mL – Most probable number per 100 milliliters of water

**Figure 21. Stormwater Samples – April 2016 Bacteria Counts in Relation to Stream Discharge and Specific Conductivity – Comal Springs Complex**

**Figure 22. Stormwater Samples – September 2016 Bacteria Counts in Relation to Stream Discharge and Specific Conductivity – Comal Springs Complex**

### 7.1.3.2 Stormwater – Volatile Organic Compounds (VOCs)

There were no VOC detections in stormwater samples during the April or September 2016 storm events. Acetone was detected at a concentration of 7.21 J µg/L in the trip blank associated with the peak samples from September 26, 2016.

### 7.1.3.3 Stormwater – Semi-volatile Organic Compounds (SVOCs)

Generally, SVOCs were analyzed because their detection can indicate the presence of chemicals originating from anthropogenic sources; and therefore, can be used to evaluate potential impacts on water quality. No SVOCs were detected at any of the five sampling sites in the Comal Springs complex during the April 2016 stormwater sampling event. One SVOC, DEHP, was detected in six samples from the September 2016 stormwater sampling event. All of the detections are “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. Four DEHP detections exceeded the PCL of 6 µg/L. SVOC detections are listed below in Table 11 and shown graphically in Figure 23.

**Table 11. Stormwater Samples – Semi-volatile Organic Compound Detections – Comal Springs Complex**

Location	Date	Bis(2-ethylhexyl) phthalate (µg/L)
HCS240 Trail	4/13/16	<5.00
	9/27/16	9.28 J
HCS260 Lead	4/12/16	<5.00
	9/26/16	5.33 J
HCS270 Lead	4/12/16	<5.00
	9/26/16	6.28 J
HCS270 Peak	4/13/16	<5.00
	9/26/16	6.74 J
HCS270 Trail	4/13/16	<5.00
	9/27/16	7.43 J
FDHCS270 Trail	4/13/16	<5.00
	9/27/16	5.81 J
PCL		6

J – Detection is greater than the method detection limit, but less than the reporting limit

µg/L – micrograms per liter

PCL – protective concentration level

**Figure 23. Bis(2-ethylhexyl) Phthalate (DEHP) in Comal Springs Complex Stormwater Samples September 2016 Compared to Protective Concentration Level (PCL)**

#### **7.1.3.4 Stormwater – Herbicides and Pesticides**

One organophosphorus pesticide and one herbicide were detected in stormwater samples from the Comal Springs complex in 2016.

The organophosphorus pesticide, disulfoton, was detected in one sample during the September 2016 storm event. The detection occurred at HCS260 Lead at a concentration of 0.373 J µg/L. This detection is “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. The detection is well below the MCL of 0.98 µg/L.

The herbicide compound, 2,4-D, was detected during the storm event in the Comal Springs complex sampled during both the April and September 2016 events. The compound was detected in a total of five samples. All of the detections are “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. None of the detections approach the MCL of 70 µg/L for 2,4-D.

Herbicide detections are summarized below in Table 12.

**Table 12. Stormwater Samples – Herbicide Detections – Comal Springs Complex**

Location	Date	2,4-D (µg/L)
HCS210 Trail	4/13/16	<0.0354
	9/27/16	0.0368 J
HCS240 Peak	4/13/16	0.0677 J
	9/26/16	<0.0356
HCS250 Peak	4/13/16	0.227 J
	9/26/16	<0.0351
HCS270 Lead	4/12/16	0.255 J
	9/26/16	<0.0350
HCS270 Peak	4/13/16	0.216 J
	9/26/16	<0.0350
MCL		70

J – Detection is greater than the method detection limit, but less than the reporting limit

µg/L – micrograms per liter

MCL – maximum contaminant level

#### **7.1.3.5 Stormwater – Polychlorinated Biphenyls (PCBs)**

Stormwater samples were analyzed for the various Aroclor compounds that are generally referred to collectively as PCBs. None of the stormwater samples from the Comal Springs complex indicated positive detections of PCB compounds during the April or September 2016 sampling events.

#### **7.1.3.6 Stormwater – Metals**

Stormwater samples were analyzed for metals in accordance with the EAHCP Work Plan. Several positive metal detections were noted in the sample set; however, no samples contained a metal at a concentration in excess of the drinking water MCL and most detections were below laboratory reporting limits.

#### **7.1.3.7 Stormwater – Nitrates**

Stormwater samples were analyzed for nitrate-nitrite as nitrogen in accordance with the EAHCP Work Plan. All nitrate results were below the MCL of 10 mg/L. For the April 2016 event, the range of nitrate results was 0.492 J mg/L to 1.77 mg/L, with an average of 1.49 mg/L. During the September 2016 event, nitrate concentrations ranged from 0.404 J mg/L to 1.78 mg/L, with an average of 1.33 mg/L. For comparison the average nitrate in spring water samples at Comal Springs for calendar year 2014 was 1.91 mg/L (EAA 2015). Nitrate results are summarized in Table 13.

**Table 13. Stormwater Samples – Nitrate Detections  
– Comal Springs Complex**

	9/27/2016	1.63
MCL		10

J – Detection is greater than the method detection limit, but less than the reporting limit

mg/L – milligrams per liter

### 7.1.3.8 Stormwater – Caffeine

Stormwater was analyzed for caffeine, which can indicate an anthropogenic source. Caffeine may enter surface water from leaking sewer or septic systems or it may be present in the aquifer from similar sources in the recharge zone (EPA 2012). Potential ecological effects are currently unknown but could include reduced reproductive success of aquatic organisms (EPA 2012). Caffeine detections in stormwater samples from Comal Springs in April 2016 ranged from 45 ng/L to 110,000 ng/L. In September 2016, caffeine detections ranged from 13 ng/L to 920 ng/L. There is no regulatory standard or expected value for comparison. These results are shown in Table 14.

**Table 14. Stormwater Samples – Caffeine Detections – Comal Springs Complex**

#### **7.1.4 Comal Springs Surface Water Passive Sampling**

PDSs were installed in the Comal Springs system in February, April, June, August, October and December 2016. The PDS was not analyzed from site HCS460 in April 2016 due to sediment collection on the deployment device. Any changes to deployment locations or non-recovered samplers are discussed in Appendix C.

Rain events did occur during some PDS deployment periods during 2016. Figures 24–29 show specific conductivity and discharge for each PDS deployment period. In April 2016, samplers were removed from the river after a period of 12 days instead of the 14 days as called for in the EAHCP Work Plan. A large storm was forecasted for the area. When the forecast was brought to the attention of EAA staff, EAA requested the PDS be retrieved prior to the storm event because of concerns that samplers could be lost and that the PDS results would not reflect base flow conditions. This deviation is discussed in greater detail in Appendix C.

There is not a suitable set of regulatory standards to compare PDS results to, but rather the data are a qualitative tool for evaluating the presence of trace concentrations of organic compounds. PDSs were analyzed for a suite of SVOCs, VOCs, and organochlorine pesticides. Few compounds were detected, the most notable are relatively consistent detections of tetrachloroethene. Positive detections are shown in Table 15.

TPH – total petroleum hydrocarbons

µg – micrograms

## **7.2     San Marcos Springs Sample Results**

The surface waters associated with the San Marcos Springs complex were sampled for surface water (base flow) conditions in March and September 2016. In general, few detections were noted. As discussed previously, surface water samples are compared to the drinking water standards for water quality in this report.

Sediments at the San Marcos Springs complex were sampled in June 2016. Sediment results were compared to the standards developed by McDonald et al. (2000). These standards are based on the probability of a detected compound having a toxic effect on sediment dwelling organisms and are referred to as the TEC and PEC. Detections below the TEC are not considered to be toxic, whereas detections above the PEC are considered to be toxic to sediment-dwelling organisms. Detections above the TEC but less than the PEC are considered to be equally likely to be toxic or non-toxic.

Stormwater events were sampled at the San Marcos Springs complex in March and November 2016. Generally speaking, stormwater results did not indicate a significant number of detections of concern.

PDS sampling events were conducted at the San Marcos Springs complex in February, April, June, August, October, and December 2016. Generally speaking, various VOCs and TPH were detected at various sample locations, but only tetrachloroethene was relatively consistently detected.

### **7.2.1    San Marcos Springs Surface Water / Base Flow Sampling**

The San Marcos Springs complex was sampled on March 3 and September 9, 2016, for surface water (base flow) events.

#### ***7.2.1.1 Surface Water / Base flow – Bacteria***

Bacteria results for surface water (base flow) associated with the San Marcos Springs complex ranged from 5 MPN/100 mL through 91 MPN/100 mL for *E. coli*. Because of the presence of various fauna in surface water collection sites, positive detections are common. The 2014 Texas Surface Water Quality Standard for *E. coli* in primary recreation waters is a geometric mean of 126 MPN/100 mL with no individual sample exceeding 399 MPN/100 mL (30 TAC 307.7). The geometric mean for surface water samples collected from the San Marcos Springs complex during 2016 was approximately 33 MPN/100 mL. No surface water samples collected from the San Marcos Springs in 2016 exceeded the individual sample limit of 399 MPN/100 mL. Surface water (base flow) bacteria counts are summarized in Table 16.

**Table 16. Surface Water Samples – Bacteria Counts

MPN/100 mL – most probable number per 100 milliliters

#### **7.2.1.2 Surface Water / Base Flow – Volatile Organic Compounds (VOCs)**

No VOCs were detected in the San Marcos Springs surface water samples in March or September 2016.

#### **7.2.1.3 Surface Water / Base Flow – Semi-volatile Organic Compounds (SVOCs)**

Surface water samples were analyzed for SVOCs because their detection can indicate the presence of chemicals originating from anthropogenic sources; and therefore, can be used to evaluate potential impacts on water quality. Three SVOCs were detected in surface water samples from the San Marcos Springs complex. Note all detections are “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. All detections of DEHP in San Marcos surface water samples from 2016 were above the PCL of 6 µg/L. Di-n-butyl phthalate was detected in the method blank associated with the September 2016 samples at a concentration of 3.858 µg/L, this may have affected detection results. Detections are summarized in Table 17 and DEHP detections are shown in Figure 30.

**Table 17. Surface Water Samples – Semi-volatile Organic Compound Detections – San Marcos Springs Complex**

Location	Date Collected	Bis(2-ethylhexyl) phthalate (µg/L)	Diethyl phthalate (µg/L)	Di-n-butyl phthalate (µg/L)

MCL		NE	NE	NE
PCL		6	20000	2400

B – Analyte was detected in associated method blank

J – Detection is greater than the method detection limit, but less than the reporting limit

MCL – maximum contaminant level

NE – not established

PCL – protective concentration level

µg/L – micrograms per liter

**Figure 30. Bis(2-ethylhexyl) Phthalate (DEHP) in San Marcos Springs Complex Surface Water Compared to Protective Concentration Level (PCL)**

#### **7.2.1.4 Surface Water / Base Flow – Pesticides**

Surface water samples were analyzed for pesticides because their detection can indicate the presence of chemicals originating from anthropogenic sources; and therefore, can be used to evaluate potential impacts on water quality. No pesticides were detected in any of the San Marcos Springs complex surface water samples during March and September 2016. Due to an error at the laboratory, water samples for organophosphorus pesticides collected on September 9, 2016 were resampled October 24, 2016. This deviation is discussed further in Appendix C of this report.

#### **7.2.1.5 Surface Water / Base flow – Herbicides**

Surface water samples were analyzed for herbicides because their detection can indicate the presence of chemicals originating from anthropogenic sources; and therefore, can be used to evaluate potential impacts on water quality. Herbicides were not detected for the March or September 2016 sampling events at any of the seven sites for the San Marcos Springs complex.

#### **7.2.1.6 Surface Water / Base Flow – Polychlorinated Biphenyls (PCBs)**

Surface water samples were analyzed for the various Aroclor compounds that are generally referred to collectively as PCBs. PCBs are sampled because their detection can indicate the presence of chemicals originating from anthropogenic sources and therefore help in the evaluation of potential impacts on water quality. PCBs were not detected for the March or September 2016 sampling events at any of the seven sites for the San Marcos Springs complex.

### 7.2.1.7 Surface Water / Base Flow – Metals

Surface water samples were analyzed for metals because their detection can indicate the presence of chemicals originating from anthropogenic sources; and therefore, can be used to evaluate potential impacts on water quality. Although metals were detected for both the March and September 2016 sampling events at all seven sites for the San Marcos Springs complex, no metals of concern were detected at concentrations in excess of the drinking water standards. Arsenic, barium, chromium, copper, lead, manganese, selenium, and zinc were detected; however, none of their concentrations exceeded a regulatory standard. These detections are listed in Table 18. Note many detections are “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit.

**Table 18. Surface Water Samples – Metal Detections – San Marcos Springs Complex**

### 7.2.1.8 Surface Water / Base Flow – Nitrates

Surface water samples were analyzed for nitrate-nitrite as nitrogen. Laboratory analyses indicated a limited range of nitrate-nitrite as nitrogen in surface water samples. Of the 16 surface water samples (14 environmental samples and two field duplicates) collected for the two sample events, concentrations ranged

from 0.585 mg/L to 1.68 mg/L. None of the nitrate concentrations exceeded the MCL of 10 mg/L for drinking water. The highest nitrate concentration in surface water at the San Marcos Springs complex was 1.68 H mg/L from HSM130 sampled on September 9, 2016. Nitrate-nitrogen results are summarized in Table 19. Due to oversight at the laboratory some nitrate samples were analyzed outside of hold time in September 2016 this is further discussed in Appendix C.

**Table 19. Surface Water Samples – Nitrate Detections – San Marcos Springs Complex**

Location	Date	Concentration (mg/L)
HSM110	3/3/2016	0.706 H

MCL		10

H – Analyzed outside hold time, result included for comparison but not considered valid

mg/L – milligrams per liter

#### **7.2.1.9 Surface Water / Base Flow – Caffeine**

Surface water base flows were analyzed for caffeine, which can indicate the possible presence of human wastewater discharge. Caffeine may enter surface water from leaking sewer or septic systems or it may be present in the aquifer from similar sources in the recharge zone (EPA 2012). Potential ecological effects are currently unknown but could include reduced reproductive success in aquatic species (EPA 2012). Caffeine detections in surface water samples from San Marcos Springs in 2016 ranged from 2.6 ng/L to 53 ng/L. There is no regulatory standard or expected value for comparison. Results are shown in Table 20.

**Table 20. Surface Water Samples – Caffeine  
Detections – San Marcos Springs Complex**

Location	Date Collected	Caffeine (ng/L)

## 7.2.2 San Marcos Springs Sediment Sampling

### 7.2.2.1 Sediment – Volatile Organic Compounds (VOCs)

VOCs were detected in sediment samples collected at all of the seven sample sites in the San Marcos Springs complex in 2016. Note many detections are “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. Methylene chloride was detected in the method blank at a concentration of 56.6 J µg/kg, which may affect detection results. None of the detected compounds have established TEC and PECs. The detections are summarized below in Table 21.

**Table 21. Sediment Samples – Volatile Organic Compound Detections – San Marcos Springs Complex**

Location	Date Collected	Acetone (µg/kg)	2-Butanone (µg/kg)	Methylene chloride (µg/kg)	p-Isopropyltoluene (µg/kg)	Toluene (µg/kg)
HSM310	6/9/16	226 J	40.4 J	<60.2	<4.75	<10.8
HSM320	6/9/16	247 J	33.3 J	<68.5	<5.41	129

TEC		NE	NE	NE	NE	NE
PEC		NE	NE	NE	NE	NE

B – Analyte was detected in associated method blank

J – Detection is greater than the method detection limit, but less than the reporting limit.

µg/kg – micrograms per kilogram

NE – Not established

PEC – probable effect concentration

TEC – threshold effect concentration

### 7.2.2.2 Sediment – Semi-volatile Organic Compounds (SVOCs)

Several SVOC compounds were detected in the sediment samples collected in the San Marcos Springs system in 2016. Many of these detections are “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. The discussion of SVOC detections presented below is divided between non-PAH and PAH compounds.

#### **Non-Polycyclic Aromatic Hydrocarbon (PAH) Detections**

Three non-PAH SVOC compounds were detected in 2016 sediment samples from the San Marcos Spring complex, butyl benzyl phthalate, diethyl phthalate and 3- and 4-methylphenol. No TECs or PECs have been established for any of the non-PAH SVOCs detected.

Based on analysis of 2013 laboratory data, the EAA concluded that three compounds may have been laboratory artifacts. The compounds were DEHP, di-n-octyl phthalate, and di-n-butyl phthalate. The EAA noted in the *2013 Edwards Aquifer Habitat Conservation Plan Expanded Water Quality Report* (EAA 2013) that as the data set grows, additional conclusions could be drawn. The 2014 laboratory analyses of sediment samples did not detect di-n-octyl phthalate or di-n-butyl phthalate. However, DEHP was detected in three of the sediment samples (HSM320, HSM330, and HSM350) in 2014 leading SWCA to conclude it is possible DEHP is present within the sediment and not just a laboratory artifact. DEHP was detected again in three samples in 2015, HSM330, HSM340 and HSM350. In 2016, DEHP was detected in all San

Marcos sediment samples except HSM310 with concentrations ranging from 0.0671 J mg/kg to 0.668 J mg/kg. All detections in 2016 were less than the laboratory reporting limit, but were greater than the method detection limits. The detection of DEHP over the past three sampling events suggests DEHP is present within the sediment in the San Marcos River in the areas tested.

### **PAH Detections**

The remaining SVOC detections are all PAH compounds and are listed in Table 22. PAH detections are further shown in Figures 31–39, where the total PAH concentrations (sum of all detected concentrations for each sample point) and individual detections are compared to the TEC and PEC values established by MacDonald et al. (2000). Sample locations HSM340 and HSM350 exceed the TEC for total PAH concentrations. HSM320 and HSM330 exceeded the PEC for total PAH concentrations. Individual PAH compound TECs were exceeded in samples HSM320, HSM340 and HSM350. Individual PAH compound PECs were exceeded in samples HSM320 and HSM330.

Table 22. Sediment Samples – Semi-volatile Organic Compound Detections - San Marcos Springs Complex

		PAH Compounds																		Non-PAH Compounds			
Location	Date Collected	Acenaphthene (mg/kg)	Anthracene (mg/kg)	Benzo (a) Anthracene (mg/kg)	Benzo (a) Pyrene (mg/kg)	Benzo (b) Fluoranthene (mg/kg)	Benzo (g,h,i) Perylene (mg/kg)	Benzo (k) Fluoranthene (mg/kg)	Chrysene (mg/kg)	Dibenz (a,h) anthracene (mg/kg)	Dibenzofuran (mg/kg)	Fluoranthene (mg/kg)	Fluorene (mg/kg)	Indeno(1,2,3-c,d) Pyrene (mg/kg)	2-Methylnaphthalene (mg/kg)	Naphthalene (mg/kg)	Phenanthrene (mg/kg)	Pyrene (mg/kg)	Total PAH (mg/kg)	Bis(2-Ethylhexyl) Phthalate (DEHP) (mg/kg)	Butyl benzyl phthalate (mg/kg)	Diethyl phthalate (mg/kg)	3- and 4-Methylphenol (mg/kg)

### 7.2.2.3 Sediment - Pesticides

Sediment samples were analyzed for both organochlorine and organophosphorus pesticides. Organochlorine pesticides were detected in the San Marcos Springs sediment samples in 2016 at HSM320, HSM340, and HSM350. The TEC for 4,4-DDD was exceeded in samples HSM320 and HSM340. The TEC for 4,4-DDE was exceeded at HSM350. The PEC for 4,4-DDE was also exceeded at HSM320 and HSM340. Alpha-chlordane and gamma-chlordane were also detected but do not have established TEC or PECs. Concentrations are listed in Table 23. TEC and PEC exceedances are shown graphically in Figures 40 and 41.

**Table 23. Sediment Samples – Pesticide Detections - San Marcos Springs Complex**

Location	Date Collected	4,4-DDD (µg/kg)	4,4-DDE (µg/kg)	Alpha-chlordane (µg/kg)	Gamma-chlordane (µg/kg)
HSM320	6/9/16	16	103	<5.50	<4.33
HSM340	6/9/16	13.3	31.5	7.54	19.2
HSM350	6/9/16	<3.03	9.72	<2.98	<2.34
TEC		4.88	3.16	NE	NE
PEC		28	31.3	NE	NE

NE – not established

PEC – probable effect concentration

TEC – threshold effect concentration

µg/kg – micrograms per kilogram

**Figure 40. San Marcos Springs Sediment 4,4-DDD Detections Compared to Threshold Effect Concentration (TEC) and Probable Effect Concentration (PEC) values**

**Figure 41. San Marcos Springs Sediment 4,4-DDE Detections Compared to Threshold Effect Concentration (TEC) and Probable Effect Concentration (PEC) values**

#### **7.2.2.4 Sediment - Herbicides**

Sediments were analyzed for herbicide compounds to further assess sediment quality at the San Marcos Springs complex. No herbicides were detected in any of the sediment samples from the seven sites in the San Marcos Springs complex.

#### **7.2.2.5 Sediment - Polychlorinated Biphenyls**

Sediments were analyzed for PCB compounds to further assess sediment quality at the San Marcos Springs complex. Aroclor-1260 was detected at a concentration of 26.3 J µg/kg in the sediment sample collected from HSM340. This detection was “J” flagged, indicating the detected concentration is less than the laboratory reporting limit, but greater than the method detection limit. MacDonald et al. (2000) established a TEC and PEC for Total PCB compounds but not individual PCBs. The detection was not above the TEC of 59.8 µg/kg or the PEC of 676 µg/kg for Total PCBs. However, TCEQ lists a Lower Effects Level (LEL) and Severe Effects Level (SEL) for select individual PCBs (TCEQ 2012, TCEQ 2014). The detection exceeded the LEL of 5 µg/kg for Aroclor-1260. The detection did not exceed the SEL of 240 µg/kg for Aroclor-1260. The detection is shown in comparison to the LEL and SEL values for Aroclor-1260 and the TEC and PEC values for Total PCBs in Figure 42.

**Figure 42. San Marcos Springs Sediment Aroclor-1260 and Total PCB Detections Compared to Lower Effects Level (LEL), Severe Effects Level (SEL), Threshold Effect Concentration (TEC) and Probable Effect Concentration (PEC) values**

#### 7.2.2.6 Sediment - Metals

Many metals are naturally occurring within soil, rock, and sediment. Sediment sample results for metals at the San Marcos Springs complex tested positive for several metals, generally at low concentrations. Metals detected above the method detection limit and subsequently evaluated in this report for potential toxic effects using the TEC and PEC standards are: arsenic, cadmium, chromium, copper, lead, manganese, mercury, nickel, and zinc. Other metals detected that do not have a TEC or PEC value available are aluminum, antimony, barium, beryllium, iron and selenium which were compared to TSBC (TCEQ 2014b). Several samples exceeded one or more of these limits in 2016. The TEC for cadmium was exceeded in samples HSM310 and HSM350. Lead detections exceeded the TEC in samples HSM350 and HSM360. Lead concentrations also exceeded the PEC at HSM340. The manganese detection exceeded the TEC at HSM310. The Zinc concentration exceeded the TEC in sample HSM360.

All selenium detections were above the TSBC level of 0.3 mg/kg. Sediment studies of selenium concentrations have shown that levels below 4 mg/kg are not likely to bioaccumulate in the food chain or have adverse impacts on the reproduction of fish or aquatic birds (Lemly 1995; Moore et al. 1990; Van Derveer and Canton 1996). Selenium detections did not exceed 4 mg/kg in 2016 San Marcos sediment samples.

For the evaluation of antimony levels, TCEQ recommends an ERL of 2 mg/kg (TCEQ 2014) and an ERM of 25 mg/kg (TCEQ 2012). Antimony detections were “J” flagged, indicating the detected concentration is

less than the laboratory reporting limit, but greater than the method detection limit. Antimony detections at HSM330, HSM350, HSM370 and FDHSM370 exceeded the TSBC but did not exceed the ERL.

Metal detections are listed in Table 24. Metals with detections above an established TEC, TSBC or PEC value are displayed graphically in Figures 43–48, for antimony, cadmium, lead, manganese, selenium and zinc, respectively.

### 7.2.3 San Marcos Springs Stormwater Sampling

Stormwater samples were to be collected during two storm events at the San Marcos Springs complex in 2016. Each event was to be sampled according to the guidelines in the EAHCP Work Plan. The first sampling event occurred on March 9, 2016. Total rainfall for the first event was approximately 0.75 to 0.99 inches (NOAA 2016). The streamflow measured at USGS Gauge 08170500 increased from 245 cfs to 246 cfs during the event (USGS 2016), it is unclear if the gauge was operating correctly during the event, as a larger increase is generally observed during storm events. A more than 20% change in specific conductivity and other water quality parameters did occur during the event and SWCA staff observed a rise in water levels at sampling locations. Therefore, the storm event is considered valid for sampling based on the guidelines in the *EAA Groundwater Quality Monitoring Plan*. The second event occurred on November 3, 2016. Total rainfall for the November 2016 event was approximately 0.50 to 0.75 inches (NOAA 2016). The storm caused streamflow to increase from 255 cfs to 306 cfs (USGS 2016).

#### 7.2.3.1 Stormwater - Bacteria Detections

Stormwater samples collected and analyzed for bacteria analyses generally tested positive for high levels of bacteria. The 2014 Texas Surface Water Quality Standard for *E. coli* in primary recreation waters is a geometric mean of 126 MPN/100 mL with no individual sample exceeding 399 MPN/100 mL (30 TAC 307.7). The geometric mean for stormwater samples collected from the San Marcos Springs complex in March 2016 was approximately 5,065 MPN/100 mL. Bacteria counts ranged from 75 MPN/100 mL to 61,000 MPN/100 mL with several samples exceeding the individual sample limit during the March 2016 event. November 2016 *E. coli* counts ranged from 72 to >24,000 MPN/100 mL with a geometric mean of approximately 2543 MPN/100 mL. Individual detections are listed below in Table 25 and shown in relation to stream discharge and specific conductivity in Figures 49 and 50. Due to the timing of storm events and laboratory working hours, it was not possible to deliver all samples to the laboratory within sample holding times (see discussion in Appendix C). Samples exceeding hold times were included in the range and geometric mean calculations.

### 7.2.3.2 Stormwater - Volatile Organic Compounds (VOCs)

One VOC compound, acetone, was detected in several stormwater samples from the March 2016 Sampling event and one sample from the November 2016 event. All of these detections were less than the established PCL, and one exceeded the laboratory reporting limit. The detections are summarized in Table 26.

### 7.2.3.3 Stormwater - Semi-volatile Organic Compounds (SVOCs)

Stormwater samples were collected and analyzed for SVOCs. One SVOC, DEHP, was detected in HSM240 Lead in March 2016 at a concentration of 9.88 J µg/L. DEHP was also detected in several samples from the November 2016 storm event. These detections were less than the laboratory reporting limit but greater than the established PCL of 6 µg/L. These detections are summarized in Table 27 and shown graphically in Figures 51 and 52.

#### **7.2.3.4 Stormwater - Herbicides and Pesticides**

Stormwater samples were collected and analyzed for organochlorine pesticides, organophosphorous pesticides, and herbicides. There were no detections of herbicides or pesticides during the March or November 2016 stormwater event.

#### **7.2.3.5 Stormwater - Polychlorinated Biphenyls**

Stormwater samples were analyzed for the various Aroclor compounds that are generally referred to collectively as PCBs. None of the stormwater samples from the San Marcos Springs complex indicated positive detections of PCB compounds during the March or November 2016 sampling event.

#### **7.2.3.6 Stormwater - Metals**

Stormwater samples were analyzed for metals in accordance with the EAHCP Work Plan. Several positive metal detections were noted in the sample set; however, no samples contained a metal at a concentration in excess of the drinking water MCL, and many detections were below laboratory reporting limits during the March or November 2016 sampling event.

#### **7.2.3.7 Stormwater - Nitrates**

Stormwater samples were analyzed for nitrate-nitrite as nitrogen in accordance with the EAHCP Work Plan. All samples contained nitrate results below the MCL of 10 mg/L. During the March 2016 event, the

range of nitrate results was 0.687 mg/L to 1.27 mg/L, with an average concentration of approximately 1.07 mg/L. In November 2016, nitrate results ranged from 0.469 mg/L to 1.42 mg/L, with an average concentration of approximately 0.999 mg/L. For comparison, the average nitrate in spring water samples at San Marcos Springs for calendar year 2014 was 1.42 mg/L (EAA 2015). Nitrate detections are summarized in Table 28.

#### **7.2.3.8 Stormwater – Caffeine**

Stormwater was analyzed for caffeine, which can indicate an anthropogenic source. Caffeine may enter surface water from leaking sewer or septic systems or it may be present in the aquifer from similar sources in the recharge zone (EPA 2012). Potential ecological effects are currently unknown but could include reduced reproductive success in aquatic species (EPA 2012). Caffeine detections in stormwater samples from San Marcos Springs in March 2016 ranged from 7.7 ng/L to 5,100 ng/L and was detected in all samples except HCS210 Lead. Caffeine detections from November 2016 ranged from 45 ng/L to 3700 ng/L. There is no regulatory standard or expected value for comparison. Results are shown in Table 29. The caffeine sample container for HSM230 Peak from March 2016 was broken in shipment to the laboratory, so this sample was not analyzed.

#### 7.2.4 San Marcos Springs Surface Water Passive Sampling

PDSs were installed in the San Marcos Springs system in February, April, June, August, October, and December 2016. HSM430 and FDHSM430 were not analyzed in April 2016 because the deployment device was flipped upside down and sediment accumulated around the deployment device and came in contact with these PDSs. During the June 2016 PDS deployment period, the deployment device from HSM440 was lost, the sampler was found by the City of San Marcos and returned but was not analyzed. The sampler for HSM470 in October 2016 showed signs of human tampering and was not analyzed. Sediment accumulated inside the deployment device and contacted the samplers for HSM430 and FDHSM430 during the December 2016 deployment, the samplers were not analyzed. Any lost or damaged samplers and changes to deployment locations are discussed in Appendix C.

Rain events did occur during some PDS deployment periods during 2016. Figures 53–58 show specific conductivity and stream discharge rates for each PDS deployment period. In April 2016, samplers were removed from the river after a period of 12 days instead of the 14 days as called for in the EAHCP Work Plan. A large storm was forecasted for the area. When the forecast was brought to the attention of EAA staff, EAA requested the PDS be retrieved prior to the storm event because of concerns that samplers could be lost and that the PDS results would not reflect base flow conditions. This deviation is discussed in greater detail in Appendix C.

There are no regulatory standards for comparison to PDS results. PDSs were analyzed for VOCs, SVOCs, and organochlorine pesticides. Few compounds were detected, only tetrachloroethene and TPH were consistently detected. Positive detections are shown in Tables 30 and 31.

\* The field duplicate sample location was HSM430 for each sample event except for the April and December 2016 events.

## 8.0 SUMMARY OF RESULTS

SWCA staff collected surface water (base flow), stormwater, sediment, and passive diffusion samples from Comal and San Marcos springs complexes. The sampling events met the requirements of the EAHCP and provided background data for these two systems. The limited number of detections above comparative standards is indicative of generally high water quality. However, the total PAH, non-PAH SVOCs, and lead results that exceeded comparative standards were of concern. Specific compounds detected above a PCL (for water) or PEC (for sediment), are listed below in Table 32.

**Table 32. Compounds detected above Protective Concentration Levels (PCL) or Probable Effect Concentrations (PEC).**

Sample Location	Sample Type	Date	Compound	Concentration	PCL or PEC
HCS160	Surface Water (Base Flow)	September 2016	DEHP	10.1 J µg/L	6 µg/L
HCS240 Trail	Stormwater	September 2016	DEHP	9.28 J µg/L	6 µg/L
HCS270 Lead	Stormwater	September 2016	DEHP	6.28 J µg/L	6 µg/L
HCS270 Peak	Stormwater	September 2016	DEHP	6.74 J µg/L	6 µg/L
HCS270 Trail	Stormwater	September 2016	DEHP	7.43 J µg/L	6 µg/L
HSM120	Surface Water (Base Flow)	March 2016	DEHP	12.5 J µg/L	6 µg/L
HSM120	Surface Water (Base Flow)	September 2016	DEHP	6.04 J µg/L	6 µg/L
HSM130	Surface Water (Base Flow)	September 2016	DEHP	11.3 J µg/L	6 µg/L
HSM170	Surface Water (Base Flow)	September 2016	DEHP	19 J µg/L	6 µg/L
HSM320	Sediment	June 2016	Total PAH	24.148 mg/kg	22.8 mg/kg
HSM320	Sediment	June 2016	4,4-DDE	103 µg/kg	31.3 µg/kg
HSM330	Sediment	June 2016	Total PAH	26.916 mg/kg	22.8 mg/kg
HSM340	Sediment	June 2016	4,4-DDE	31.5 µg/kg	31.3 µg/kg
HSM340	Sediment	June 2016	Lead	260 mg/kg	128 mg/kg
HSM240 Lead	Stormwater	March 2016	DEHP	9.88 J µg/L	6 µg/L
HSM250 Lead	Stormwater	November 2016	DEHP	11.0 J µg/L	6 µg/L
HSM260 Peak	Stormwater	November 2016	DEHP	14.5 J µg/L	6 µg/L
HSM260 Trail	Stormwater	November 2016	DEHP	8.46 J µg/L	6 µg/L
HSM270 Peak	Stormwater	November 2016	DEHP	7.00 J µg/L	6 µg/L
HSM270 Trail	Stormwater	November 2016	DEHP	17.4 J µg/L	6 µg/L

DEHP – bis(2-ethylehexyl) phthalate

J – Detection is greater than the method detection limit but is less than the reporting limit.

mg/kg – milligrams per kilogram

PAH – Polycyclic aromatic hydrocarbon

µg/kg – micrograms per kilogram

µg/L – micrograms per liter

### **PAHs in Sediment**

PAHs are a group of SVOCs common in urban runoff (Mahler et al. 2005) that can have adverse effects on aquatic life including plants, invertebrates, and fish. The effects of exposure vary but can include organ damage, reproductive harm, or immune system weakening (Mahler et al. 2005). Coal-tar parking lot sealants have been identified as a significant source of PAHs in urban waterways and were banned from use in areas surrounding the recharge zone of the Edwards Aquifer within Comal and Hays Counties by the EAA in 2012. In each sample year thus far, levels of total PAH in sediment samples have exceeded TECs and PECs at two sites in the San Marcos Springs complex.

### **DEHP**

DEHP was detected in the majority of sediment samples from the Comal and San Marcos springs complexes in 2013. However, DEHP results were noted in the laboratory blank samples for October 2013 surface water (base flow) sampling event and were considered likely post collection contaminants or false positive detections. In general, DEHP is quite problematic in that it is common in plastics and other materials. Therefore, the EAA considered DEHP as a likely laboratory or sampling equipment artifact. DEHP was not detected in water quality samples from both spring complexes in 2014 and 2015. In 2016, DEHP was detected in multiple surface water (base flow) and stormwater samples collected from both spring complexes. Nonetheless, DEHP detections were “J” flagged indicating that the detection was greater than the method detection limit, but less than the reporting limit.

### **Lead in Sediment**

Lead has been detected at concentrations of 56.0 mg/kg, 235 mg/kg, 63.5 mg/kg, and 260 mg/kg in years 2013, 2014, 2015, and 2016, respectively at sample location HSM340. The TEC and PEC for lead are 35.8 and 128 mg/kg, respectively.

### **Proposed Activities for 2017**

In 2015, the EAHCP received the *National Academy of Sciences (NAS) Report 1* (2015), containing recommendations for EAHCP’s Monitoring, Modeling and Applied Research programs, including the Expanded Water Quality Monitoring Program. From *Report 1*, a list of water quality monitoring recommendations was presented to the NAS Recommendation Review Work Group (NAS Work Group). Based on the NAS Work Group assessment, at its February 18, 2016, meeting, the Implementing Committee convened the 2016 EAHCP Expanded Water Quality Monitoring Program Work Group (WQWG) to carry out a holistic review of the Expanded Water Quality Monitoring Program, taking into account the recommendations of NAS, the NAS Work Group, the input of the Science Committee, the Permittees, and the subject matter experts. The purpose of the WQWG was to produce a final report for review by the Implementing Committee, developed through a consensus-based decision-making process. The WQWG held meetings from March to May 2016. An overview of the approved Scope of Work 2017 can be seen in Table 33 below.

**Table 33. Overview of the Approved Scope of Work 2017**

Sample Type	Frequency
Sediment	Biennially in even years
Real-time monitoring	Add one monitoring station per system
Stormwater	<ul style="list-style-type: none"> <li>• Reduced to one sampling event per year</li> <li>• Test only for integrated pest management plan chemicals in odd years</li> <li>• Test full suite in even years as currently done</li> <li>• Add two samples to the rising limb of the hydrograph for a total of five samples per location when possible <ul style="list-style-type: none"> <li>○ Priority given to locations at tributary outflows</li> </ul> </li> </ul>
Passive Diffusion Samplers	<ul style="list-style-type: none"> <li>• Currently done</li> <li>• Add PPCP membrane only at the bottom of the channel in both systems</li> </ul>
Tissue sampling	One sample in odd years from both systems

## 9.0 DATA QUALITY OBJECTIVES

SWCA evaluated each sampling event to determine if procedures should be modified to improve data collection to ensure data quality objectives are met. Appendix C provides a discussion of problems encountered, deviations to the Work Plan, and resolutions to these circumstances. The only ongoing challenge recognized is the inability to consistently deliver *E. coli* samples to a laboratory within hold times during stormwater sampling events. This inability is inherent to stormwater sampling events due to the occurrence of storms during non-working hours. SWCA uses special runners to deliver samples to the laboratory as early as possible to minimize hold time exceedances.

Based on procedures implemented to correct or improve data collection methods and the relatively low significance of the deviations, the circumstances described in Appendix C do not compromise the integrity of the study or this report.

## 10.0 DEFINITIONS

Alkalinity	The capacity of water to neutralize acids, a property imparted by the water's content of carbonate, bicarbonate, hydroxide, and on occasion borate, silicate, and phosphate. It is expressed in milligrams per liter of equivalent calcium carbonate (mg/l CaCO <sub>3</sub> ).
Aquifer	Underground geological formation or group of formations containing water; source of groundwater for wells and springs.
ASTM	Abbreviation for American Society for Testing and Materials. A nonprofit organization that develops and publishes approximately 12,000 technical standards, covering the procedures for testing and classification of materials of every sort.
Bacteria	Microscopic living organisms that can aid in pollution control by metabolizing organic matter in sewage, oil spills, or other pollutants. However, certain bacteria in soil, water, or air can also cause human, animal, and plant health problems.
Basin	Any area draining to a point of interest.
Baseline data	Initial data generated by consistent monitoring of the same sites over time.
Caffeine	A stimulant drug found naturally in coffee, tea, and chocolate, and also within soft drinks and other foods. If detected, it might indicate an anthropogenic source of water impacts.
Channel	A long, narrow excavation or surface feature that conveys surface water and is open to the air.
Deionized water	Water with all ions removed.
Detection limit	The lowest concentration of a given pollutant that an analytical method or equipment can detect and still report as greater than zero. Generally, as readings approach the detection limit, they become less and less reliable quantitatively.
Dissolved solids	The total amount of dissolved material, organic, and inorganic, contained in water or wastewater. Measurements are expressed as ppm or mg/L.
DO	Abbreviation for dissolved oxygen. Oxygen molecules that are dissolved in water and available for living organisms to use for respiration. Usually expressed in milligrams per liter or percent of saturation. The concentration of DO is an important environmental parameter contributing to water quality.
DOC	Abbreviation for dissolved organic carbon, a broad classification of organic molecules of varied origin and composition within aquatic systems. Organic

carbon compounds are a result of decomposition processes from dead organic matter, such as plants.

DQO	Abbreviation for data quality objectives, a process used to develop performance and acceptance criteria or data quality objectives that clarify study objectives, define the appropriate type of data, and specify tolerable levels of data needed to support decisions.
Drainage	The collection, conveyance, containment, and/or discharge of surface and stormwater runoff.
EARIPHCP	Abbreviation for Edwards Aquifer Recovery Implementation Program Habitat Conservation Plan.
Endpoint	That state in titration at which an effect, such as a color change, occurs, indicating that a desired point in the titration has been reached.
Equipment blank	Sample used to assess the effectiveness of the decontamination process on sampling equipment. The equipment blank is prepared by pouring reagent-grade water over/through sampling equipment and analyzing for parameters of concern (to match the sampling routine applicable to the site).
Field duplicate	Second sample collected simultaneously from the same source as the parent sample, but which is submitted and analyzed as a separate sample. This sample should generally be identified such that the laboratory is unaware that it is a field duplicate.
Filtration	The process of separating solids from a liquid by means of a porous substance (filter) through which only the liquid can pass.
Groundwater	Water found beneath Earth's surface that fills pores between materials, such as sand, soil, or gravel.
Habitat	The specific area of environment in which a particular type of plant or animal lives and grows.
HCP	Abbreviation for Habitat Conservation Plan. A planning document that is required by the United States Fish and Wildlife Service as part of their enforcement of the Endangered Species Act.
LCS/LCSD	Abbreviation for Laboratory control samples and laboratory control sample duplicate. LCS/LCSD are evaluated to assess overall method performance and are the primary indicators of laboratory performance. In general, laboratory control samples are similar in composition as the environmental samples, contain known concentrations of all the analytes of interest, and undergo the same preparatory and determinative procedures as the environmental samples. An LCS/LCSD may be analyzed to provide information on the precision of the analytical method.

MS/MSD	Abbreviation for matrix spike/matrix spike duplicate. MS/MSD results are examined to evaluate the impact of matrix effects on overall analytical performance and potential usability of the data. A matrix spike is a representative environmental sample that is spiked with target analytes of interest prior to being taken through the entire analytical process in order to evaluate analytical bias for an actual matrix. A matrix duplicate is a collected (e.g., a VOC soil sample) or a homogenized sample that is processed through the entire analytical procedure in order to evaluate overall precision for an actual matrix.
MDL	Abbreviation for method detection limit, minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero, as determined from analysis of a sample containing the analyte in a given matrix.
MPN	Abbreviation for most probable number. An analytical method used to detect the presence of coliforms in a water sample and estimate their numbers.
PCBs	Abbreviation for polychlorinated biphenyls. Group of more than 200 chlorinated toxic hydrocarbon compounds that can be biomagnified.
PCL	Abbreviation for protective concentration levels, which is established to protect human health.
Peak	Maximum instantaneous flow at a specific location resulting from a given storm condition.
pH	A measure of the alkalinity or acidity of a substance. Also defined as the negative logarithm of the hydrogen ion concentration ( $-\log_{10}[\text{H}^+]$ ) where $\text{H}^+$ is the hydrogen ion concentration in moles per liter. The pH of a substance is neutral at 7.0, acidic below 7.0, and alkaline above 7.0.
PQL	Abbreviation for practical quantitation limit, which is the smallest concentration of the analyte that can be reported with a specific degree of confidence.
Precipitation	The discharge of water, in liquid or solid state, out of the atmosphere, generally upon a land or water surface. Precipitation includes rainfall, snow, hail, and sleet.
Precision	The ability of a measurement to be consistently reproduced.
QA/QC	Abbreviation for quality assurance/quality control. The total integrated program for assuring reliability of monitoring and measurement data.
Recession	End of runoff event, which is defined as the point in time when the recession limb of the hydrograph is $< 2\%$ of the peak or is within $10\%$ of the prestorm base flow, whichever is greater.

RPD	Abbreviation for relative percent difference. The RPD provide a measure of precision.
Representative	Said of samples collected that are similar to those of groundwater in its in situ condition.
RL	Abbreviation for reporting limit, the smallest concentration of an analyte reported by the laboratory to a customer. The RL is never less than the PQL and is generally twice the MDL.
Runoff	Precipitation, snowmelt, or irrigation water that runs off the land into surface water. Runoff can carry pollutants from the air and land into the receiving waters.
Sediment	Fragmental material that originates from weathering of rocks and is transported by, suspended in, or deposited by water or air.
Shelby Sampler	A thin-walled tube with a cutting edge at the toe. A sampler head attaches the tube to the drill rod and pressure vents. Generally used in cohesive soils. Soil or sediment sampled from this sampler is considered undisturbed.
Spring	Water coming naturally out of the ground.
Stormwater	Stormwater is the water that runs off surfaces such as rooftops, paved streets, highways, and parking lots. It can also come from hard, grassy surfaces such as lawns, play fields, graveled roads, and parking lots.
Surface water	Water that forms and remains above ground, such as lakes, ponds, rivers, streams, bays, and oceans.
SVOC	Abbreviation for semi-volatile organic compounds, which is a group of chemicals composed primarily of carbon and hydrogen that have a relatively low tendency to evaporate (volatilize) into the air from water or soil. Some of the compounds that make up asphalt are examples of SVOCs.
TDS	Abbreviation for total dissolved solids, or the total amount of all inorganic and organic substances, including minerals, salts, metal, cations, or anions that are dispersed within a volume of water.
Temporal	Over a period of time.
TKN	Abbreviation for total Kjeldahl nitrogen, which is the total concentration of organic and ammonia nitrogen in wastewater.
TOC	Abbreviation for total organic carbon, which is the gross amount of organic matter found in natural water. Suspended-particulate, colloidal, and dissolved organic matter are part of the TOC measurement. Settable solids consisting of inorganic

	sediments and some organic particulate are not transferred from the sample by the lab analyst and are not part of the TOC measurement.
TSBC	Texas-specific Background Concentrations as established by the Texas Commission on Environmental Quality.
Turbidimeter	An instrument for measuring turbidity in which a standard suspension is used for reference.
Turbidity	A measure of how clear the water is; how much the suspended material in water results in the scattering and absorption of light rays. An analytical quantity is usually reported in turbidity units and determined by measurements of light diffraction. Material that can increase turbidity (reduce clarity of water) are suspended clay, silt, sand, algae, plankton, microbes, and other substances.
Trip blank	Sample known to be free of contamination (for target analytes) that is prepared in the laboratory and treated as an environmental sample after receipt by the sampler. Trip blank samples are applicable to VOC analysis only.
TSS	Abbreviation for total suspended solids, which are the nonfilterable residue retained on a glass-fiber disk filter mesh measuring 1.2 micrometers after filtration of a sample of water or wastewater.
USGS	Abbreviation for United States Geological Services. USGS is a federal research organization that provides impartial information on health of ecosystems and environment, natural hazards that may threaten us, natural resources, impacts of climate and land use change, and core science systems which provide timely, relevant, and useable information.
VOC	Abbreviation for volatile organic compounds, which are often used as solvents in industrial processes and are either known or suspected carcinogens or mutagens. The five most toxic are vinyl chloride, tetrachloroethene, trichloroethene, 1,2-dichloroethane, and carbon tetrachloride.
Whirl-Pak®	Sterilized, clear polyethylene bag used to collect water samples for analysis.
WQAL	Abbreviation for a list of parameters defined as the following: pH, conductivity, temperature, dissolved oxygen, turbidity, and alkalinity in the field. Other parameters submitted for laboratory analysis include cations, anions, nutrients, metals, VOCs, SVOCs, herbicides and pesticides, bacteria, TOC, PCBs, and phosphorous.

## 11.0 ACKNOWLEDGEMENTS

SWCA would like to thank the San Marcos Nature Center staff, especially Melani Howard, for helping with coordination efforts and providing a work area during storm sampling activities. SWCA would also like to acknowledge the City of New Braunfels staff for coordination efforts with the local police and park staff and for coordinating sample locations and access.

The work of the SWCA stormwater sampling team is also much appreciated. Team members are listed below.

**EDWARDS AQUIFER HABITAT CONSERVATION PLAN  
(EAHCP) WORK PLAN**

---

*This page intentionally left blank.*

## **2016 Edwards Aquifer Authority Water Quality Monitoring Program Work Plan for Comal Springs and San Marcos Springs**

### **INTRODUCTION**

This Work Plan details the sampling strategy and protocols for surface water quality monitoring in 2016 for the Edwards Aquifer Habitat Conservation Plan (EAHCP) document (Section 5.7.2) implemented by the Edwards Aquifer Authority (EAA), utilizing a third party contractor. The goal of the water quality monitoring program, first implemented in 2013, is to detect water quality impairments that may negatively impact the listed species. In the event that certain constituents of concern are detected at levels indicating the potential for adverse effects, the Implementing Committee member with jurisdictional authority will be consulted to identify sources and consider Best Management Practices (BMPs) to reduce and/or eliminate the constituents of concern. If necessary, additional testing could be included in the current or following year to assist in determining the source of contamination and the Science Committee could be consulted to assist with BMP identification and source determination.

### **SCOPE OF WORK**

The Water Quality Monitoring Program described below includes surface water, storm water, groundwater, and sediment sampling within Comal Springs and San Marcos Springs and associated river systems. Sample collection and analyses performed by EAA staff in 2013, has been performed by a contractor since 2014.

For 2016, the contractor will use the same sampling locations used in 2014 and as shown in the attached figures. However, changes in springflow, surface water runoff, land use, site security and access may dictate minor modification to sample collection locations and schedules as sampling efforts progress. Any minor changes resulting from these factors that are necessary as a result of safety or equipment concerns will be noted in the field sample sheets and dedicated field books. Should logistics or safety issues require any significant changes to this work plan, the sampling contractor shall report those issues to the EAA. Subsequently, the EAA will present those changes to the Science and Implementing committees for review and approval as needed prior to their implementation.

### **COMAL SPRINGS**

Comal Springs discharges an average of 291 cubic feet second (cfs) into Landa Lake, located within the city of New Braunfels, Texas. Comal Springs is considered a spring complex with multiple discharge points along the 4,500 foot reach of Landa Lake. The springs issue from the Edwards Group limestone along the 4,500-foot section of the northeast-southwest trending escarpment formed by the Comal Springs Fault. Landa Lake forms the headwaters of the Comal River which flows approximately two miles before entering the Guadalupe River.

Discharge measurements have been collected from Comal Springs since 1933 and the EAA has been collecting water quality samples for more than ten years. In recent years, the EAA has been collecting samples from Spring 1, Spring 3, and Spring 7 on a quarterly basis during normal flow conditions and on a monthly basis when the San Antonio pool critical period triggers have been reached. Spring 1, Spring 3, and Spring 7 discharge into Landa Lake and make up part of the Comal Springs complex. Figure 1 indicates these historical groundwater sampling locations. Water quality samples are collected and analyzed for: dissolved oxygen (DO), pH, conductivity, and temperature, in the field and for alkalinity<sup>1</sup>. Samples are also submitted to the EAA contract laboratory for analysis of cations, anions, nutrients, metals, volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), herbicides, pesticides, bacteria, total organic carbons (TOC), dissolved organic carbons (DOC), polychlorinated biphenyls (PCBs), and phosphorous. For the purposes of EAHCP related water sampling, the analyte caffeine has been added to the list of analyzed parameters. This list of parameters is defined as the water quality analytical list (WQAL).

### **Sampling Methods**

All samples will be collected following the EAA's *Field Sampling Plan* or contractor established methodology upon approval by the EAA. Samples shall be analyzed by a National Environmental Laboratory Accreditation Program (NELAP) accredited contract laboratory. To date no requests to deviate from the EAA's *Field Sampling Plan* have been received or approved.

### **EAHCP Surface Water Sampling Locations**

To comply with sampling requirements outlined in the EAHCP, five additional surface water sampling locations (Figure 2) were identified in the 2013 EAHCP Water Quality Work Plan for intensive monitoring in the Landa Lake and Comal River area as listed below:

- Upper Springs (near Blieders Creek);
- Upper Landa Lake - (near Spring Island);
- Lower Landa Lake - (above outfalls);
- Upper Old Channel - (Elizabeth Street); and,
- USGS Gauge - (above San Antonio Street Bridge).

---

<sup>1</sup> Alkalinity analysis will be conducted within eight hours of sample collection.

### **Surface Water Sampling Frequency**

In 2016, water samples will be collected twice from each of the five surface water locations listed above. The interval between sampling events will be approximately six months. Samples will be collected in March and September. Water samples will be analyzed for the WQAL parameters and caffeine using a NELAP laboratory. A listing of analytical parameters is provided in Appendix A.

### **Sediment Sampling**

One sediment sample will be collected during June 2016 from each of the surface water sampling locations (Figure 2). Three samples will be collected from each sample site and composited into a single sample for analysis (to minimize VOC loss, it is recommended the compositing process be performed at the laboratory). Sediment samples will be analyzed for the analytical parameters provided in Appendix B. Results of sediment sampling analysis will be used to formulate future sediment sampling at Landa Lake and the Comal River. Sediment samples will be collected from zero to three inches below the surface for calendar year 2016. Sediment sample intervals will likely vary in subsequent sample years based on the results of each year of sediment analyses.

### **Storm Water Sampling Program for Comal Springs**

Two storm water sampling events will be performed in 2016 to evaluate storm water quality from the urban landscape. A storm water sampling event will be triggered when the flow rate at the United States Geological Survey (USGS) Comal Springs gauging station (#08169000) increases by five percent or there is a twenty percent change in three of the five water quality parameters measured in the downstream real time water quality monitoring probe. Three water quality samples will be collected and analyzed from each surface water sampling location during the sampling event. Sample times will be spaced to reflect changes in the stream hydrograph (initial rise, peak flow, and recession limb). Water samples will be analyzed for the WQAL parameters and caffeine using a NELAP laboratory. A listing of analytical parameters for storm water samples is provided in Appendix A.

The following locations will be sampled for storm water as indicated on Figure 3:

- Upper Springs (near Blieders Creek);
- New Channel – (below confluence with Dry Comal Creek);
- Upper Old Channel - (at Elizabeth Street);
- Lower Old Channel - (above Hinman Island); and,
- Comal River - (above confluence with Guadalupe River).

### **Groundwater Sample Collection for Extreme Low Flow Scenarios for Comal Springs**

In the event total springflow at Comal Springs (as measured by USGS Comal Springs gauging station #08169000) drops below 30 cfs, the EAHCP (6.4.3.3) calls for weekly monitoring of three wells in the vicinity of the spring complex for DO, conductivity, pH, and temperature. Should springflow be at 20 cfs, then additional parameters to include nutrients, total dissolved solids (TDS), and TOC are to be added to the weekly sample regimen. Analytical parameters for all low flow sampling is included in Appendix A. Based on conditions during the drought of record (circa 1950s), sampling for lower flow scenario could last for up to 21 weeks. The three specific wells

to be used will be determined at the time of low flow sample initiation, based on well conditions and aquifer levels.

### **Real Time Instrument Water Quality Data Logging Program for Comal Springs**

Continuous water quality monitoring stations will continue in 2016 at the following locations indicated on Figure 4:

Spring Run 3;  
Spring 7; and,  
New Channel (below confluence with Dry Comal Creek).

Monitoring will be performed using a data logging sonde capable of collecting data on 15 minute intervals. The parameters measured will include temperature, dissolved oxygen, pH, turbidity, and conductivity. These data will be evaluated to identify short-term and long-term water quality variations of the spring system as well as changes in water quality related to storm water runoff.

**This monitoring effort will continue to be performed by EAA staff in 2016.**

### **Collection of Passive Diffusion Samples (Passive Samples) at Comal Springs**

Passive samples are to be collected during the 2016 sampling effort using a passive diffusion type sampling device. Devices will be obtained from Amplified Geochemical Imaging LLC (AGI), or equivalent to the AGI device for functionality and analytical parameters. Sample locations for PDS samples are provided in Figure 5. The passive sampling effort shall be performed in February, April, June, August, October, and December. The devices shall be installed for a two-week interval at the same locations as the base flow surface water samples. Specifically at the sample points below.

Upper Springs (near Bleiders Creek);  
Upper Landa Lake - (near Spring Island);  
Lower Landa Lake - (above outfalls);  
Upper Old Channel - (Elizabeth Street); and,  
USGS Gauge - (above San Antonio Street Bridge).

The general parameter set for PDS samples is listed in Appendix A, under *Analytical Parameters for Passive Diffusion Samplers, Comal and San Marcos Springs*.

## **SAN MARCOS SPRINGS**

Located in San Marcos, Texas on the campus of Texas State University, San Marcos Springs discharges an average of 176 cfs into Spring Lake. The springs issue from the Edwards Group limestone along the northeast-southwest trending escarpment formed by the San Marcos Springs

Fault. Spring Lake forms the headwaters of the San Marcos River. Discharge measurements have been collected from San Marcos Springs since 1957 and the EAA has been collecting water quality samples for more than ten years.

In recent years, the EAA has been collecting samples from Deep Spring and Hotel Spring on a quarterly basis during normal flow conditions and on a monthly basis when the San Antonio pool critical period triggers have been reached. Both Deep and Hotel springs are located in the bed of Spring Lake and make up part of the San Marcos Springs complex. Figure 6 indicates these historical groundwater sample locations at San Marcos Springs. Water quality samples are collected and analyzed for: dissolved oxygen (DO), pH, conductivity, and temperature, in the field and for alkalinity<sup>2</sup>. Samples are also submitted to the EAA contract laboratory for analysis of cations, anions, nutrients, metals, VOCs, SVOCs, herbicides, pesticides, bacteria, TOC, PCBs, and phosphorous. For the purposes of EAHCP related water sampling, the analyte caffeine has been added to the list of analyzed parameters. This list of WQAL parameters is an identical to the list of parameters analyzed for at Comal Springs.

### **Sampling Methods**

All samples will be collected following the EAA's *Field Sampling Plan* or contractor established methodology upon approval by the EAA. Samples shall be analyzed by a NELAP accredited contract laboratory. To date no requests to deviate from the EAA's *Field Sampling Plan* have been received or approved.

### **Surface Water Sampling Locations**

To comply with sampling requirements outlined in the EAHCP document, seven additional surface water sampling locations (Figure 7) were identified in the 2013 HCP work plan for intensive monitoring as listed below:

- Sink Creek;
- Spring Lake;
- Sessoms Creek;
- City Park;
- Rio Vista Dam;
- I-35 reach; and,
- Capes Dam/Willow Creek.

---

<sup>2</sup> Alkalinity analysis will be conducted within eight hours of sample collection.

**Surface Water Sampling Frequency**

In 2016, water samples will be collected twice from each of the seven surface water locations listed above. The interval between sampling events will be approximately six months. Samples will be collected in March and September. Water samples will be analyzed for the WQAL parameters and caffeine using a NELAP laboratory. A listing of analytical parameters is provided in Appendix A.

**Sediment Sampling**

One sediment sample will be collected during June 2016 from each of the surface water sampling locations (Figure 7). Three samples will be collected from each sample site and composited into a single sample for analysis (it is recommended that compositing of the sample be performed at the laboratory to minimize VOC loss). Sediment samples will be analyzed for the analytical parameters provided in Appendix B. Results of sediment sampling analysis will be used to formulate future sediment sampling at Spring Lake and the San Marcos River. Sediment samples will be collected from zero to three inches below the surface for calendar year 2016. Sediment sample intervals will vary in subsequent sample years based on the results of each year of sediment analyses.

**Storm Water Sampling Program for San Marcos Springs**

Two storm water sampling events will be performed in 2016 to evaluate storm water runoff from the urban landscape. A storm water sampling event will be triggered when the flow rate at the USGS San Marcos Springs gauging station (#08170500) increases by five percent or there is a twenty percent change in three of the five water quality parameters measured in the downstream real time water quality monitoring probe. Three water quality samples will be collected from each surface water sampling location during the sampling event. Sampling times will be spaced to reflect changes in the stream hydrograph (initial rise, peak flow, and recession limb). Water samples will be analyzed for the WQAL parameters and caffeine using a NELAP laboratory. A listing of analytical parameters is provided in Appendix A, for storm water samples.

The following locations will be sampled for storm water as indicated on Figure 8:

- Sink Creek;
- Sessoms Creek;
- Dog Beach Outflow;
- Hopkins Street Outflow;
- Purgatory Creek (above San Marcos River);
- I-35 Reach; and
- Willow Creek (above San Marcos River).

**Groundwater Sample Collection for Extreme Low Flow Scenarios for San Marcos Springs**

In the event total springflow at San Marcos Springs (as measured by USGS San Marcos Springs gauging station (#08170500)) drops below 50 cfs, the EAHCP (6.4.4.3) calls for weekly monitoring of three wells in the vicinity of the spring complex for DO, conductivity, pH, and temperature. Should springflow drop below 30 cfs, then additional parameters to include Nutrients, TDS, and TOC are to be added to the sample regimen. Analytical parameters for all low flow sampling is included in Appendix A. Based on conditions during the drought of record (circa 1950s), sampling for lower flow scenario could last for up to 21 weeks. The three specific wells to be used will be determined at the time of sampling abased on well conditions and aquifer levels.

**Real Time Instrument Water Quality Data Logging Program for San Marcos Springs**

Continuous water quality monitoring stations were established in 2013 and will continue in 2016 at the following locations indicated on Figure 9:

USGS gauging station;  
Rio Vista Dam; and  
Capes Dam/Willow Creek.

Monitoring will be performed using a data logging sonde capable of collecting data on 15 minute intervals. The parameters measured will include temperature, dissolved oxygen, pH, turbidity, and specific conductance. These data will be evaluated to identify short-term and long-term water quality variations of the spring system as well as changes in water quality related to storm water runoff. **This monitoring effort will continue to be performed by EAA staff in 2016.**

In 2015, an additional water quality data logging point was installed at Capes Dam/Willow Creek area that coincident with surface water sample point HSM 170 (Capes Dam/Willow Creek area). The additional station will help with the timing of storm sample collection as well as improved monitoring of the IH-35 and Willow Creek runoff impacts.

**Collection of Passive Diffusion Samples (Passive Samples) at San Marcos Springs**

Passive samples are to be collected during the 2016 sampling effort using a passive diffusion type sampling device. Devices will be obtained from AGI, or equivalent to the AGI device for functionality and analytical parameters. Sample locations for PDS samples are provided in Figure 10. The passive sampling effort shall be performed in February, April, June, August, October, and December. The devices shall be installed for a two-week interval at the same locations as the base flow surface water samples. Specifically at the sample points that follow.

Sink Creek;  
Spring Lake;  
Sessoms Creek;  
City Park;  
Rio Vista Dam;  
I-35 reach; and,  
Capes Dam/Willow Creek.

The general parameter set for PDS samples is listed in Appendix A, under *Analytical Parameters for Passive Diffusion Samplers, Comal and San Marcos Springs*.

### **WATER QUALITY MONITORING REPORT**

The contractor will compile and present sampling results in an annual report to the EAA. The report will include an evaluation of analytical data, graphs of results that exceed comparative or regulatory standards, a discussion of water and sediment quality, laboratory reports and field data sheets, photographs, sampling locations and rationale, description of sampling methods, and a description and rationale for any deviations from the Water Quality Sampling Plan due to logistics or safety issues. The report is to be submitted in hard copy and electronically and will be reviewed internally by EAA. The deadline for submittal to the EAA is December 21, 2016.

### **DATA COMPILATION, ANALYSES AND REPORTING**

All of the data collected as a result of the 2016 HCP Water Quality Monitoring Plan will be compiled, and analyzed, and the results will be presented to the Implementing Committee by February 15, 2017; prior to inclusion in the annual EAHCP Annual Report that is required by Sections 6.2.4 and 9.3 of the EAHCP and Section 11.1c of the Implementing Agreement. The report will include an evaluation of all analytical data, including graphs, key photographs and general summary of results.

### **CHANGES TO WORKPLAN FROM THE 2014 SAMPLING EFFORT**

In summary, the work plan has few changes from 2015. Funding is requested for maintenance and replacement needs for existing RTIs, as well as data transmission and web hosting fees. Detail for the RTIs is listed in Appendix C.

### **SCIENCE COMMITTEE REVIEW**

This 2016 Water Quality Work Plan was reviewed by the EAHCP Science Committee at their April 2015 meeting. They recommended no additions or changes for 2016.

## **BUDGET**

Table 7.1 Budget: \$200,000

Requested work plan Budget: \$497,530.00

2016 EAHCP Sampling as performed by an outside contractor, annual costs \$474,430.00

Real Time Instruments (RTI): \$23,100.00 (see Appendix C)

### **Justification for Budget Adjustment**

The real time water quality data logging instrumentation is in need of funding for maintenance, in addition spare instrumentation is needed to prevent extended down time in the event of catastrophic failure. The instruments also require funding for calibration fluids, batteries, and other incidental costs. Cost details are provided in Appendix C.

**Figure 1**  
**Comal Springs Groundwater Sample Locations**

Most of the historical EAA sampling records for Comal Springs pertains to the locations known as Spring 1, Spring 3, and Spring 7 (spring vents). Other locations at Comal Springs may have a limited sample record.

Samples are collected monthly during low flow conditions (critical period), and quarterly during normal conditions.

**Comal Springs HCP Related Sample Points**

**Passive Diffusion Samplers (PDS)**

**Notes:**

PDS devices are to be placed at the locations listed herein, for a two-week time period in the months of February, April, June, August, October, and December.

PDS devices will be from Amplified Geochemical Imaging, LLC, or equivalent and shall provide analyses for: TPH, BTEX, 1,3,5 and 1,2,4-trimethylbenzene, MTBE, phenanthrene, naphthalene 1-methyl naphthalene, octane, cis and trans-1,2-dichloroethane, 1,1-dichloroethane, chloroform, 1,1,1-trichloroethane, 1,2-dichloroethane, carbon tetrachloride, trichloroethene, tetrachloroethene, chlorobenzene, 1,4-dichlorobenzene, 1,1,2-trichloroethane, 1,1,1,2-tetrachloroethane, 1,1,2,2-tetrachloroethane, 1,3-dichlorobenzene, and 1,2-dichlorobenzene.

**Explanation**

★ Passive Diffusion Sampler Location

**Prepared by:**

**Figure 6**  
**San Marcos Springs Groundwater Sample Locations**

Most of the historical EAA sampling records for San Marcos Springs pertains to the locations known as Hotel and Deep (spring vents). Other locations at San Marcos Springs may have a limited sample record.

Samples are collected monthly during low flow conditions (critical period), and quarterly during normal conditions.

## **APPENDIX C**

### **DISCUSSION OF DEVIATIONS**

---

*This page intentionally left blank.*

## **Appendix C Discussion of Deviations**

### **Comal Springs**

#### **Surface Water (Base Flow)**

Surface water was collected in the Comal Springs complex in March and September 2016. Surface water (base flow) sampling locations did not deviate from the *2016 Edwards Aquifer Authority Water Quality Monitoring Program Work Plan for Comal Springs and San Marcos Springs* (EAHCP Work Plan) (EAA, 2015).

#### **March 2, 2016, and September 8, 2016, Collection**

In accordance with the EAHCP Work Plan (EAA, 2015), filtration for metals and alkalinity samples was performed in the field by collecting water with disposable bailers and attaching filters to the bailers. Alkalinity analysis was performed at the SWCA office in San Antonio. Because the hold-time for pH analysis is only 15 minutes, laboratory analysis of pH was performed outside of hold time, but pH was measured in the field as part of the water quality parameter data set.

#### **March 2, 2016, Collection**

An error in the field resulted in the loss of the water quality parameter data collected at site HCS120.

#### **September 8, 2016, Collection**

Organophosphorus pesticides samples were mislabeled at the contract laboratory after extraction from the original sample containers. There was no way for the laboratory to distinguish the identities of the samples, so they had to be re-extracted. This second extraction occurred outside of the hold time for organophosphorus pesticide analysis. New samples for organophosphorus pesticides were collected October 24, 2016.

#### **Stormwater**

Stormwater events were sampled April 12-13 and September 26-27, 2016, in the Comal Springs complex. Infrequent qualifying storm events made storm water sampling exceedingly difficult to perform in the second half of 2016. Rain events were generally scattered in nature and often too small in magnitude to generate sufficient runoff to sample. Storm water sampling locations did not deviate from those proposed in the EAHCP Work Plan.

#### **April 12-13, 2016, Event**

Lead sample collection began at approximately 23:00 on April 12, 2016, making it impossible for *E. coli* samples to reach the laboratory within the 6-hour hold time. The peak occurred at approximately 01:45 on April 13, 2016, also making it impossible for *E. coli* samples to reach the laboratory within the 6-hour hold time. Lead and Peak samples were submitted when the contract laboratory opened on the morning of April 13, 2016. Trail samples were collected and delivered to the laboratory on April 13, 2016, within hold time.

Because the hold-time for pH analysis is only 15 minutes, laboratory analysis of pH was performed outside of hold time, but pH was measured in the field as part of the water quality parameter data set. Due to timing of the storm, alkalinity samples HCS240 Peak, HCS250 Peak, HCS260 Peak and HCS270 Peak were analyzed outside of hold time.

#### September 26-27, 2016, Event

It was not possible for the Comal Springs lead or peak *E. coli* samples to be delivered to the contract laboratory within holding times due to the timing of the storm. The specific conductivity in the Comal River recovered but began to fall again several times and storm cells continued to materialize or dissipate in the immediate vicinity making it impossible for SWCA to predict when samples would need to be collected and when a staff member could be spared to deliver samples to the laboratory. Lead sample collection began at approximately 03:00 on September 26, 2016. They were to be delivered to the laboratory when it opened at 08:00. However, specific conductivity peaked abruptly and peak sample collection began at approximately 07:00 making staff unavailable to deliver the samples. A runner was called in to deliver the samples to the laboratory as soon as possible. Following peak collection specific conductivity began to fall again, SWCA staff deployed to sampling locations in order to collect an additional peak sample. At this time it was determined that the Comal River was being influenced by backflow from the Guadalupe River and the peak samples collected at 07:00 would be analyzed. SWCA staff delivered the peak samples to the laboratory as soon as possible following this decision. Trail samples were collected on September 27, 2016 and were delivered to the laboratory within holding times. Because the hold-time for pH analysis is only 15 minutes, laboratory analysis of pH was performed outside of hold time, but pH was measured in the field as part of the water quality parameter data set.

Turbidity readings from the sonde used by one sampling team did not appear accurate in the field. The turbidity measurements were the same at sites HCS210, HCS240 and HCS260 during the lead sample. The turbidity result of 200 NTU was assumed correct at HCS210 Lead but not for HCS240 Lead and HCS260 Lead. The sonde appeared to be functioning correctly at HCS210 but that reading became locked in for the additional sampling locations. Turbidity for HCS240 Lead and HCS260 Lead was not included in the data set.

#### **Sediments**

Sediment samples were collected from the Comal Springs complex on June 8, 2015. The EAHCP Work Plan (EAA, 2015) designated sediment collection sites to coincide with surface water collection points but allowed for some deviation from these locations as field conditions dictated. Sediment samples were collected more than 30 feet from surface water collection points due to limited amounts of available sediment at the surface water locations at HCS340 and HCS360. Sediment collection location deviations are discussed below.

## HCS340

Surface water samples are collected from the eastern side of Elizabeth Avenue at this sample site, however the substrate in this area is very rocky with a strong current and little to no sediment. Sediment samples were collected upstream on the western side of Elizabeth Avenue, approximately 30 feet from the road. Sediment was collected approximately ten feet from the southern shore as shown in Figure 1.

Figure 1. HCS340 Sample Location.

## HCS360

Surface water collection occurred on the upstream side of the bridge near the western bank at this location. Sediment was collected on the upstream side of the bridge approximately 12 feet from the eastern bank due to high river depth and limited available sediment near the surface water sample location, as shown in Figure 2. A sediment field duplicate was also collected in the same location.

Figure 2. HCS360 Sample Location.

Due to a laboratory oversight nitrates were not analyzed within holding times for the sediment samples.

### **Passive Diffusion Samplers**

Passive diffusion samplers (PDSs) were deployed at each of the surface water sample collection sites. When at all possible, deployment locations coincided with the surface water locations. Some adjustments had to be made to account for river depth, accessibility by SWCA staff for installation and retrieval, and potential interference by the public. PDSs were deployed for two-week periods during the months of February, April, June, August, October, and December 2016.

Storm events did occur during some PDS deployment periods. Rain events large enough to cause an increase in discharge at the USGS Streamflow gauge in the Comal River occurred during PDS deployments during April, August, and December 2016. A large storm was forecasted for April 16 to 18, 2016. PDS were deployed in the river April 4, 2016 and scheduled to be retrieved April 18, 2016. Per EAA request the PDS were retrieved prior to the storm event on the morning of April 16, 2016 after 12 days of exposure opposed to the normal 14 days. The PDS were collected early to reduce the risk of samplers being lost in the field during high storm flows and results not adequately reflecting base flow conditions. Figures 24 to 29 in the main body of this report show specific conductivity and discharge readings during each PDS deployment period.

Any alterations to sample locations or lost PDS are discussed below.

#### HCS460

April 2016 – PDS deployment device was flipped over. A large amount of vegetation and sediment came in contact with the sampler. The sampler was not analyzed due to contact with collected sediment.

## **San Marcos**

### **Surface water**

Surface water was collected in the San Marcos Springs complex in March and September 2015. Surface water sampling locations did not deviate from the EAHCP Work Plan (EAA, 2015).

#### **March 3, 2016, and September 9, 2016, Collection**

Because the hold time for pH analysis is only 15 minutes, laboratory analysis of pH was performed outside of the hold time. However, pH was measured in the field as part of the water quality parameter data set. In accordance with the EAHCP Work Plan (EAA, 2015), filtration for metals and alkalinity samples was performed in the field by collecting water in disposable bailers and attaching filters to the bailers. Alkalinity analysis was performed at the SWCA office in San Antonio.

#### **March 3, 2016, Collection**

Samples were picked up by laboratory staff at the SWCA office on the morning of March 4, 2016 for delivery to the laboratory in Corpus Christi, TX. Samples did not arrive at the Corpus Christi laboratory until the morning of March 5, 2016. This caused nitrate samples for HSM110, FDHSM110, HSM120, and HSM130 to be analyzed outside of hold time. SWCA staff addressed this issue with the laboratory and was assured samples would be delivered promptly in the future.

Alkalinity samples FDHSM110, HSM120, HSM130, HSM150, HSM160, and HSM170 were analyzed outside of hold time.

Caffeine was not analyzed from HSM230 Peak, the bottle containing the sample from was broken in shipment to the laboratory.

#### **September 9, 2016, Collection**

Organophosphorus pesticides samples were mislabeled at the contract laboratory after extraction from the original sample containers. There was no way for the laboratory to distinguish the identities of the samples, so the samples had to be re-extracted. This second extraction occurred outside of the hold time for organophosphorus pesticide analysis. New samples for organophosphorus pesticides were collected October 24, 2016.

### **Stormwater**

Stormwater events were sampled March 9, 2016 and November 3, 2016, in the San Marcos Springs complex. Stormwater sampling locations did not deviate from those proposed in the EAHCP Work Plan.

#### **March 9, 2016, Event**

Lead sample collection began at approximately 01:30 on March 9, 2016 making it impossible to deliver *E. coli* samples to the laboratory within the 6-hour hold time. All samples were submitted when the contract laboratory opened on the morning of March 9, 2016. Because the hold-time for pH analysis is only 15

minutes, laboratory analysis of pH was performed outside of hold time. However, pH was measured in the field as part of the water quality parameter data set. HSM240 samples were collected using bailers from the pedestrian bridge approximately 60 feet upstream of the surface water sampling location.

The streamflow measured at USGS Gauge 08170500 increased from 245 cfs to 246 cfs during the event (USGS, 2015), it is unclear if the gauge was operating correctly during the event as a larger increase is generally observed during storm events. A more than 20% change in specific conductivity and other water quality parameters did occur during the event and SWCA staff observed a rise in water levels at sampling locations. Therefore, the storm event is considered valid for sampling based on the guidelines in the EAA Groundwater Quality Monitoring Report.

#### November 3, 2016, Event

All sample collection occurred between 16:30 and 21:30 on November 3, 2016, making it impossible to deliver the *E. coli* samples to the contract laboratory within hold times. The samples were delivered to the laboratory as soon as possible on the morning of November 4, 2016. Samples for the remaining analyses were picked up by the other contract laboratory on November 4, 2016. Laboratory analyses of pH have a hold time of only 15 minutes, therefore pH analyses were performed outside of hold time. However, pH was measured in the field as part of water quality parameter monitoring. Due to a laboratory oversight sample HSM210 Trail was analyzed outside of hold time for organophosphorus pesticides. HSM240 samples were collected using bailers from the pedestrian bridge approximately 60 feet upstream of the surface water sampling location.

#### **Sediment**

Sediment samples were collected from the San Marcos Springs complex June 9, 2016. The EAHCP Work Plan (EAA, 2015) designated sediment collection sites to coincide with surface water collection points but allowed for some deviation from these locations as field conditions dictated. Sediment samples were collected more than 30 feet from surface water collection points due to limited amounts of available sediment and river depth at HSM310, HSM350, and HSM370. Sediment collection location deviations are discussed below.

### HSM310

Surface water samples were collected from the center of the downstream side of the West Laurel Street Bridge. The bottom of this area has many large rocks and little exposed sediment. Sediment samples were collected approximately six feet upstream of the bridge, approximately five feet from the eastern bank. Sample locations are shown below in Figure 3.

Figure 3. HSM310 Sample Location

## HSM350

Water depth and access along the Rio Vista Park footbridge limited the possibilities for sediment collection. Sediment samples were collected on the east side of the island approximately 15 feet to the east of the island. Sample locations are shown below in Figure 4.

Figure 4. HSM350 Sample Location

## HSM370

Surface water samples are collected near the middle of the channel on the upstream side of the Cape Street Bridge. High water depth, strong current, and rocky bottom limited sediment collection possibilities. Sediment samples were collected approximately ten feet from the western bank of the Cape Street Bridge, as shown in Figure 5. A field duplicate was collected at the same location.

Figure 5. HSM370 Sample Location

Due to a laboratory oversight, nitrate samples were not analyzed within hold times for sediment samples.

### **Passive Diffusion Sampling**

Passive diffusion samplers were deployed at each of the surface water sample collection sites. When at all possible, deployment locations coincided with the surface water locations. Some adjustments had to be made to account for river depth, accessibility by SWCA staff for installation and retrieval, and interference by the public. PDSs were deployed for two-week periods during the months of February, April, June, August, October and December 2016. In 2014, SWCA staff designed and constructed a concrete and stainless steel deployment device to hold the PDS. Use of the devices continued throughout 2016.

Storm events did occur during some PDS deployment. Rain events large enough to cause a change in discharge at the USGS streamflow gauge in the San Marcos River occurred during PDS deployments in April, August, and December 2016. A large storm was forecasted for April 16 to 18, 2016. PDS were deployed in the river April 4, 2016 and scheduled to be retrieved April 18, 2016. Per EAA request the PDS were retrieved prior to the storm event on the morning of April 16, 2016 after 12 days of exposure opposed to the normal 14 days. The PDS were collected early to reduce the risk of samplers being lost in the field during high storm flows and results not reflecting base flow conditions. Figures 53 to 58 in the main body of this report show specific conductivity and discharge readings during each PDS deployment period.

Any alterations to sample locations or lost PDS are discussed below.

## HSM420

In 2014, the PDS location for HSM420 was moved downstream from the surface water collection site to an area with easier and safer access for SWCA staff. This location was used for all 2016 deployments. The sample location is shown below in Figure 6.

Figure 6. HSM420 sample location.

## HSM430

In 2014, the PDS location for HSM430 was moved upstream from the surface water collection site, as shown in Figure 7. This area was chosen because a children's education program accesses the river near the main sampling site. The upstream location protects the PDS from interference by the children and any sediment disturbed by their activity. This location was utilized throughout 2016.

April 2016 – Deployment device was found on its side, buried in sediment. The sampler was not analyzed due to contact with the sediment. The field duplicate sampler was also contained in this device and was not analyzed. Each PDS contains two sampling sections that can be split to act as a field duplicate when necessary. The sampler from HSM440 was split to act as a replacement field duplicate for this sampling period.

December 2016 – Coarse gravel sediment collected on the deployment device, filling the bottom of the stainless steel cup and contacting the samplers. The samplers were not analyzed due to the contact with the sediment.

Figure 7. HSM430 Sample Location

#### HSM440

June 2016 – The deployment device was not recovered from the river. The top portion of the device with the sampler intact was found by City of San Marcos staff and returned to SWCA. The sampler was not analyzed.

#### HSM450

June 2016 – The deployment device was found approximately 75 feet downstream of its deployment location. It was assumed this was due to human tampering and the sampler was not analyzed.

#### HSM470

October 2016 – The deployment device was found partially open. It was assumed this was due to human tampering and the sampler was not analyzed.

## **SECTION 1**

### **PURPOSE AND OBJECTIVES**

#### **1.1 PURPOSE AND OBJECTIVES OF THE PLAN**

Data derived from water quality sampling and analysis provide the primary indicator of the state of water quality in the Edwards Aquifer. These data are also a key component of assessing water quality changes over time. Water quality data also compose the primary source of information for our understanding and monitoring of contaminant loading and migration in the Edwards Aquifer. As such, analytical samples collected for assessing water quality must be collected under a set of standard operating procedures (SOPs), which are outlined in this plan. Included herein are sections on data quality objectives (DQOs), sampling programs, analytical methods, field procedures, and guidelines for plan review.

The purpose of this plan is to provide an SOP document ensuring that useful, consistent, and defensible water quality data are produced by implementation of appropriate procedures and methods when water quality samples are being collected and analyzed. Water quality samples are currently collected under various sampling programs at the Edwards Aquifer Authority (EAA). Data quality requirements vary by program and are discussed in Sections 2 and 3.

Section 2 of this plan provides a description of DQOs in general, as well as DQOs for this program. Section 3 provides detailed information for each of the sampling programs. Section 4 provides a listing of analytical methods used by the EAA, as well as data-flagging requirements, information for sample containers, hold times, and sample preservation. Section 5 outlines field procedures; Section 6 discusses staff training and field audits. Section 7 provides information regarding annual plan review, and Section 8 provides a list of references cited in the document. The appendices (A–G) provide maps of sample locations, a glossary of terms, instrument operation and calibration information, field forms, information on regulatory limits for various compounds, stormwater sample-collection details, and equipment-decontamination procedures.

The purpose of this plan can be achieved by implementation of the objectives listed below and discussed in detail in Sections 2–7 of the plan. Each EAA staff member charged with the responsibility of collecting water quality or other analytical samples is required to be familiar with this plan, along with the objectives and procedures outlined in it. The objectives of this plan are to

- Obtain quality data that are defensible for their intended purpose,

- Analyze field samples in an appropriate and consistent manner such that the results are accurate and repeatable (see calibration procedures in Appendix C),
- Collect samples for laboratory analysis in an appropriate and consistent manner that will ensure accurate and reliable analytical results with a minimal number of anomalous data,
- Select sample sites and time periods that will provide representative water quality data for a range of aquifer conditions, and
- Review the plan annually and revise as needed.

## SECTION 2

### DATA QUALITY OBJECTIVES

The U.S. Environmental Protection Agency (U.S. EPA) has developed criteria for data quality objectives utilizing a seven-step process that optimizes sample collection and analysis on the basis of data uses, fiscal budget, sample quantity, and other parameters (U.S. EPA, 2000). The process is iterative and may be modified by the planning team to incorporate changes as required:

- 1. State the Problem**  
Define the problem, identify the planning team, and examine the budget and schedule.
- 2. Identify the Decision**  
State the decision, identify study questions, and define alternative actions.
- 3. Identify Inputs to the Decision**  
Identify information needed for the decision, such as information sources, bases for action level, and sampling and analysis methods.
- 4. Define the Boundaries of Study**  
Specify sample characteristics, and define spatial/temporal limits and units of decision making.
- 5. Develop a Decision Rule**  
Define parameters for decision rules, specify action levels, and develop logic for action.
- 6. Specify Tolerable Limits on Decision Errors**  
Set acceptable limits for decision errors relative to consequences (health effects, costs, other impacts).
- 7. Optimize the Design for Obtaining Data**  
Select a resource-effective sampling and analysis plan that meets performance criteria.

#### 2.1 U.S. EPA DQO Process as Applied to EAA Analytical Programs

##### 2.1.1 DQO—State the Problem

Collect and analyze groundwater, spring water, and surface water samples that are contained in, issue from, or provide recharge to the Edwards Aquifer. In addition, collect stormwater and sediment samples as needed to satisfy program requirements. Sampling activities are to be conducted such that sufficient funding is held in reserve to collect confirmation samples if needed. In addition, the program must be flexible enough to collect samples in the event of a contingency (spill or other event) that affects or could potentially affect water quality of the Edwards Aquifer. The planning team includes the

Chief Technical Officer (CTO) and supervisory staff of the Aquifer Science Team of the EAA. Budget is proposed by the team and presented for board approval annually. The schedule is annual, with a general goal of collecting a minimum of 80 samples from wells, sampling all major springs (monthly or quarterly, depending on hydrologic conditions), and sampling surface waters twice annually while maintaining a budget reserve sufficient to address other needs (confirmation and contingency sampling).

Under a separate budget, the same team is charged with collecting surface water, stormwater, and sediment samples in support of the Edwards Aquifer Habitat Conservation Plan (EAHCP). Surface water, stormwater, and sediment samples are collected upstream, within, and downstream of Comal and San Marcos springs. Comal Springs has five designated sample locations, whereas San Marcos Springs has seven. Surface water and stormwater samples are to be collected twice annually, whereas sediment samples are collected once annually for the first year (to obtain baseline sediment quality information). Subsequent years may vary depending on results. See *Water Quality Monitoring Program Strategy for Comal Springs and San Marcos Springs in Support of the Edwards Aquifer Habitat Conservation Plan* (EAHCP Workplan).

### **2.1.2 DQO—Identify the Decision**

The decision is to collect the samples as described earlier under the sampling programs and protocols outlined in detail in this document. Study questions are:

- Can the quality of water entering into, residing in, and issuing forth from the Edwards Aquifer be representatively monitored?
- For the allowed budget, how many analytical parameters can be collected?
- What analytical parameters are the most informative with regard to water quality?
- Can a relevant data set that provides historical and current water quality information as relates to the Edwards Aquifer, be developed and maintained?
- Can the data indicate trends in water quality over time?
- Can contingency sampling functionally define contaminant flowpaths and ultimately help in the prevention of public exposure to contaminants in the event of a spill?
- How does the EAA functionally share the information collected with stakeholders and the public?

Alternative actions are to

- Modify the analytical parameter list to accommodate budget constraints,
- Reduce the number of sample points and sample frequency if needed to accommodate budget constraints, and

- Continually review results to assess the need for, and feasibility of, modifying the parameter list such that analytical parameters collected provide the most information for the program, as well as cost-effective information.

### **2.1.3 DQO—Identify Inputs to the Decision**

Sample frequency, sample type, and analytical program are all based on many inputs. The EAA strategic plan dictates minimum sample numbers, for example. Other inputs of importance include findings from karst researchers worldwide regarding the varying nuances of sampling in karst environments (i.e., multiple samples from a single location are generally more valuable than single samples from multiple locations). Assimilating and incorporating information gleaned from EAA sample results annually provide significant inputs to the process as well.

Action levels as defined for this study are not directly comparable to action levels for hazardous waste cleanup. In this program, action levels generally depend on sample type and program: for example, stormwater samples are triggered by specific stormwater events. Action levels may also be related to contingencies. If a contaminant of concern is detected in relation to a contingency, then additional sampling may be triggered. In other cases, an action level may be reached if an anthropogenic compound is detected above a regulatory limit. The resulting action will generally be to utilize additional sampling so as to delineate a possible source if a “contaminant” is the trigger.

Sampling and analysis methods are specific to each sampling program and are designed to provide data on water quality and changes to water quality that may occur over time. Results of each program are reviewed regularly, and changes to the parameters for each program may be made on the basis of these reviews or other needs. All programs are generally analyzed for field parameters (conductivity, dissolved oxygen [DO], turbidity, pH, and temperature) at the time the sample is collected. Other laboratory analytical parameters are then designated on the basis of the program.

### **2.1.4 DQO—Define Boundaries of the Study**

Spatially the study is limited to the Edwards Aquifer Region, which includes contributing area, recharge zone, and artesian zone of the aquifer, as well as contiguous areas that may be pertinent to data collection. Temporal limits are defined by sample program and hydrologic condition. Temporal parameters are described in more detail under sample programs.

### **2.1.5 DQO—Develop a Decision Rule**

Decision rules are defined by multiple factors:

- Strategic plan,
- Board directives,
- Approved budget,

- Data analyses and results,
- Historical data for a particular site, and
- EAHCP requirements.

#### **2.1.6 DQO—Specify Tolerable Limits on Decision Errors**

Decision-error limits are dictated by sample program. Whereas all results are considered important, contingency samples have an elevated priority because of the potential to provide a warning to the public in the event water quality is impacted. As such, in the event of a major contingency that requires long-term sampling and analysis, the budget impact would be significant. In some scenarios, additional laboratory funding would be requested from the board to cover these costs. Other sample programs are expected to be well planned and orchestrated such that no budget overruns occur.

The goal of the program in general is to collect a number of samples adequate to monitor the health of the Edwards Aquifer with high confidence that results are representative and accurate. These samples are collected through various sampling programs, as outlined in the next section.

#### **2.1.7 DQO—Optimize the Design for Obtaining Data**

The sampling plan as designed provides a resource-effective plan that meets performance criteria through data review, data assessment, and program requirements. The design is optimized by the data needs of each sample program, in which analytical parameters are specific to a program and designed to provide a maximum number of data cost-effectively.

### **2.2 Additional Inputs for DQO Process**

Another definition of DQOs is provided by the Air Force Center for Environmental Excellence (AFCEE) in its *Quality Assurance Project Plan* (QAPP), which states that “DQOs specify the data type, quality, quantity, and uses needed to make decisions and are the basis for designing data collection activities” (AFCEE, 2001). The U.S. EPA and the AFCEE both generally utilize DQOs for hazardous waste clean-up sites, which often represent a threat to public health and the environment. However, sampling programs at the EAA differ in that most samples taken are “clean” and are not used to assess the success of a clean-up action.

Therefore, for the purposes of this plan, DQOs are met by assigning a level of precision and procedural techniques and parameter suites that are appropriate for the sample type and monitoring program. Whereas it is the purpose of this plan for all data produced to be representative and fully defensible, all data do not necessarily need to be analyzed by reference methods in the analytical laboratory utilizing a full suite of QA/QC samples. Most water quality samples collected are intended for monitoring the general status of water quality within the Edwards Aquifer, with one potential exception. In some cases, contingency sampling may be used to assess the impact of an event (i.e., a spill) to the Edwards Aquifer that has the potential for public health implications.

Therefore, DQOs developed for this document are designed to provide data of quality and quantity adequate to reflect the needs of the sample program under which a particular sample is collected. Most analytical data collected are designed to assess

- The presence or absence of anthropogenic compounds in the sample.
- Changes to chemical quality of the sample point when compared with prior data,
- Development of data adequate to establish a record of water quality such that future changes to water quality can be measured,
- Measurement of changes to water quality against changes in hydrologic conditions, and
- In the case of confirmation samples, assessment with a high degree of confidence the presence or absence of a compound of interest.

## **SECTION 3**

### **SAMPLING PROGRAMS AND OBJECTIVES**

Water quality samples are collected under one of the EAA sample programs described in detail in this section. Sample parameters vary with the sample program. For a better understanding of the sampling programs and sample distribution, typical water quality sample locations, see Appendix A, which is a listing of sample type and program. EAHCP sample locations are also provided.

#### **3.1 SAMPLE TYPES AND SAMPLE PROGRAMS**

Sample type is simply defined by source and media. The EAA collects samples from wells, springs, surface water, and, at times, groundwater in caves. Samples of soil or sediment may also be collected under some circumstances. As such, sample types are:

- Wells (applies to groundwater samples and includes water collected in caves),
- Springs,
- Surface water,
- Soil or sediment, and
- Stormwater.

Sample programs exist for each sample type, driving the DQO process for a given sample. Each sample program has a defined sample frequency and analytical parameter list. However, the analytical parameter list is always subject to future revision to accommodate changing circumstances. Table 3-1 summarizes current sample types and individual sample programs conducted by the EAA.

**Table 3-1. Sample Types and Sample Programs**

Sample Type	Sample Program	Sample Frequency	Analytical Parameters
Wells	Passive	Quarterly	FP, GWQP, VOC, TPH, TOC, PAH, metals, bacteria
	NAWQA	Annually	FP, GWQP, VOC, 8081B, 8141A, 8151A, 8082A, TOC, PAH, metals, bacteria
	Routine	Annually	FP, GWQP, VOC, 8081B, 8141A, 8151A, TOC, PAH, metals, bacteria
	TWDB	Annually	FP, GWQP, VOC, 8081B, 8141A, 8151A, TOC, PAH, metals, bacteria
	PPCP	Annual	FP, PPCP (limited to nine wells annually)
	Contingency	As needed	Defined by contingency event
	Confirmation	As needed	Defined by detection needing confirmation
	QA/QC	Per QA needs	Defined by QA program
	EAHCP	Water level dependant	FP, GWQP, TOC, TDS
Springs	Primary	Quarterly (noncritical period) Monthly (critical period)	FP, GWQP, SVOC, VOC, 8081B, 8141A, 8151A, 8082A, TOC, metals, total phosphorous, bacteria, orthophosphate as P
	Secondary	Annually	FP, GWQP, SVOC, VOC, 8081B, 8141A, 8151A, 8082A, TOC, metals, total phosphorous, bacteria
	PPCP	Annually	FP, PPCP (limited to six spring samples annually)
	Contingency	As needed	Defined by contingency event
	Confirmation	As needed	Defined by detection needing confirmation
	QA/QC	Per QA needs	Defined by QA program
Surface water	Primary	Twice annually	FP, GWQP, 8081B, 8141A, 8151A, 8082A, TOC, PAH, metals, total phosphorous, bacteria
	Secondary	Annual	FP, GWQP, 8081B, 8141A, 8151A, 8082A, TOC, PAH, metals, total phosphorous, bacteria
	EAHCP	Twice annually	FP, GWQP, VOC, SVOC, 8081B, 8141A, 8151A, 8082A, TOC, metals, total phosphorous, bacteria, TKN, DOC
	PPCP	Annually	FP, PPCP (limited to two surface water samples annually)
	Contingency	As needed	Defined by contingency event
	Confirmation	As needed	Defined by detection requiring confirmation
	QA/QC	Per QA needs	Defined by QA program
Soil/sediment	EAHCP	Annually	FP, GWQP, VOC, SVOC, 8081B, 8141A, 8151A, 8082A, TOC, metals, total phosphorous
	Contingency	As needed	Defined by contingency event
	Confirmation	As needed	Defined by detection requiring confirmation
	QA/QC	Per QA needs	Defined by QA program
Stormwater	EAHCP	Twice annually	FP, GWQP, VOC, SVOC, 8081B, 8141A, 8151A, 8082A, TOC, metals, total phosphorous, bacteria, TKN
	Confirmation	As needed	Defined by detection requiring confirmation
	QA/QC	Per QA needs	Defined by QA program

FP=field parameter, GWQP=general water quality parameters, SVOC=semivolatile organic compound, VOC=volatile organic compound, TOC=total organic carbon, TKN=total kjeldahl nitrogen, PPCP=personal care and pharmaceutical products., PAH=polynuclear aromatic hydrocarbons, TPH=total petroleum hydrocarbons, DOC=dissolved organic compounds

### 3.2 SAMPLE PROGRAM DETAIL

The sample types and programs summarized in Table 3-1 comprise the various analytical samples collected and analyzed by the EAA. Specific details of each program are provided in this section.

#### Sample Programs for Well Sample Types

##### 1. Passive Sampling Program

The passive sampling program is a program to provide continuous monitoring of particular wells (referred to as sentinel wells) through the use of a passive sampling device. The device currently used is the Amplified Geochemical Imaging (AGI), LLC passive diffuse sample module (aka, Gore Module). This device utilizes a sorbent material encased in GoreTex® fabric that is capable of detecting certain analytes for volatile and semivolatile compounds, as well as petroleum hydrocarbon compounds. The Gore Modules are hung at specific intervals continuously in a sentinel well and replaced each month. The module is then shipped to AGI, LLC. for analysis (which is included as part of the module cost). Currently six wells designated as sentinel wells are located in Medina, Bexar, and Hays counties. These wells are sampled via grab sample quarterly. Sample parameter selection for this sample type is generally based on collecting parameters that are also detectable by the Gore Module, plus some additional parameters of value to an understanding of long-term trends in water quality. Sample frequency is also selected to detect temporal changes in water quality at a single sample point.

##### 2. National Water Quality Assessment (NAWQA) Program

The NAWQA wells are a series of thirty wells installed by the USGS for long-term assessment of water quality on a regional and national scale. Ten of these wells (all in the recharge zone of Bexar County) are sampled annually. The sample parameter list is selected on the basis of the NAWQA program and is used to contribute data to that study, as well as to build a historical record of water quality for the EAA data set. Ten out of 30 NAWQA wells are sampled annually, and every well must be sampled within a three-year period.

##### 3. Routine Water Quality Monitoring

Routine water quality samples are collected from a variety of well types (monitoring, domestic, agricultural, industrial, and municipal) to provide a data set for water quality regionwide for different well types. Sample parameters are broad in spectrum and designed to detect the most common anthropogenic compounds, as well as to document changes in concentrations of common cations and anions. These wells are generally sampled annually or less frequently.

**4. Texas Water Development Board (TWDB)**

Twenty TWDB samples are collected at designated wells using a split-sample technique, such that a sample set is sent to the TWDB contract laboratory (at no cost to the EAA). The remaining sample is sent to the EAA contract laboratory and analyzed for some of the same (TWDB) parameters, as well as additional parameters. This sample type provides a cost-effective tool for evaluation and comparison of analytical results for certain parameters (metals and anions). These wells (or springs, in some cases) are sampled annually under this program for a wide variety of parameters and are also used to assess the health of the system and to establish potential changes or trends in quality.

**5. Pharmaceuticals and Personal Care Products (PPCPs)**

These parameters detect various compounds found in common personal care products, as well as medications and household items. The primary value in this sample group is the conclusiveness of the data. Because the detection limits are low and the percentage of detections (at low concentrations) to date is high, this sample program appears to provide the most conclusive evidence of anthropogenic impacts on the Edwards Aquifer. The current sample budget allows for nine wells, six springs, and two surface waters to be sampled annually for these parameters. The same locations are sampled each year (with some exceptions) to provide a temporal record of water quality changes associated with the compounds. This program is being evaluated for an increase in sample frequency at some locations.

**6. Contingency Samples**

Contingency samples are collected only on an as-needed basis to assess potential contamination events related to spills or similar contingencies that have a high potential for affecting water quality in the Edwards Aquifer. Sample parameters and sample frequency are determined on the basis of type of spill (or other contingency), as well as the size of the event. Sample parameters and frequency are decided on by management. EAA staff members are subsequently directed to an appropriate course of action on the basis of assessment of the event by management.

**7. Confirmation Samples**

Confirmation samples are samples collected in response to an unexpected detection at a site where additional confirmation is needed in order to assess the probability that detection is not a sampling artifact or otherwise false detection. Confirmation detections are method and analyte specific and are taken at the direction of management.

**8. QA/QC Samples**

QA/QC samples are discussed in detail in Section 3.3.

**9. EAHCP Drought Contingency-Sampling of transect wells and Springs**

Well samples collected for the EAHCP are collected only when certain springflow criteria are met—specifically, low-flow situations at Comal and San Marcos springs. For Comal Springs, when flows fall below 30 cubic feet per second (cfs), weekly monitoring at three wells is to be conducted for DO, conductivity, pH, and temperature. The next trigger at Comal Springs is 20 cfs, and weekly monitoring is conducted using the same parameters plus nutrients, TDS, and TOC. For San Marcos Springs, the first trigger is 50 cfs, and the second trigger is 30 cfs.

**Sample Programs for Spring Sample Types****1. Primary Springs**

Primary springs are Comal, Hueco, and San Marcos. They are sampled monthly during critical periods (critical period = a ten-day average when water levels at Bexar, County, index well J-17 of below 660 feet msl, and/or a ten-day average springflow rate at either Comal or San Marcos springs is less than 225 cfs for Comal Springs and less than 96 cfs for San Marcos Springs). During noncritical periods, sampling is generally conducted quarterly. Sample parameters are extensive because the springs represent a composite sample of aquifer water and are directly associated with habitat for threatened and endangered species.

**2. Secondary Springs**

Secondary springs generally produce a smaller volume of springflow and may or may not be located within the San Antonio Segment of the Edwards Aquifer. These springs are Las Moras (Fort Clark Springs), San Pedro, San Antonio, Government Canyon, and other springs that may be designated for infrequent sampling. Las Moras is generally sampled annually, whereas the others are sampled quarterly or annually if flowing. Sample parameters are the same as those for the primary springs, except that sample frequency differs between primary and secondary.

**3. Pharmaceuticals and Personal Care Products (PPCPs)**

These parameters detect various compounds found in common personal care products, as well as medications and household items. The primary value in this sample group is the conclusiveness of the data. Because the detection limits are low and the percent of detections (at low concentrations) to date are high, this sample program appears to provide the most conclusive evidence of anthropogenic impacts on the aquifer. The current sample budget allows for nine wells, six springs, and two surface waters to be sampled annually for these parameters. The same locations are sampled each year (with some exceptions)

to provide a temporal record of water quality changes associated with the compounds. This program is being evaluated for an increase in sample frequency at some locations.

#### **4. Contingency Samples**

Contingency samples are collected only on an as-needed basis to assess potential contamination events related to spills or similar contingencies that have a high potential for affecting water quality in the Edwards Aquifer. Sample parameters and sample frequency are determined on the basis of type of spill (or other contingency), as well as the size of the event. Sample parameters and frequency are decided on by management. EAA staff members are subsequently directed to an appropriate course of action on the basis of assessment of the event by management.

#### **5. Confirmation Samples**

Confirmation samples are samples collected in response to an unexpected detection at a site where additional confirmation is needed in order to assess the probability that detection is not a sampling artifact or otherwise false detection. Confirmation detections are method and analyte specific and are taken at the direction of management.

#### **6. QA/QC Samples**

QA/QC samples are discussed in detail in Section 3.3.

#### **7. Drought Contingency-Sampling of transect wells and Springs**

### **Sample Programs for Surface Water Sample Types**

#### **1. Primary Surface Water**

Primary surface waters are collected twice annually from eight locations: Nueces River at Laguna, Dry Frio River at Reagan Wells, Frio River at Concan, Sabinal River near Sabinal, Seco Creek at Miller Ranch, Hondo Creek near Tarpley, Medina River at Bandera, and Blanco River at Wimberley. These sample locations have a significant historical sample record and provide information regarding the quality of waters that effectively provide recharge to the Edwards Aquifer. Sample parameter lists are fairly significant, but do not generally include VOCs because of the low probability of detection of these compounds in a surface water environment.

#### **2. Secondary Surface Water**

Secondary surface water sites may have varying locations and are generally sampled only annually. They are generally sites of interest because of their ability to provide recharge to the aquifer, or they may be indicators of water

quality from springs issuing forth from the Trinity Aquifer. Sample parameter lists are fairly significant but do not generally include VOCs because of the low probability of detection of these compounds in a surface water environment.

### **3. EAHCP Surface Water Samples**

EAHCP surface water samples are collected at Comal and San Marcos springs; Comal Springs has five sample locations, whereas San Marcos has seven sample locations, which are situated upstream and downstream of the spring orifice locations. Parameters provide a broad spectrum of analyses so that water quality might be better understood in detail at these locations. The parameters list will also be used to study trends in water quality at these locations over time. Sample frequency is twice annually.

### **4. Pharmaceuticals and Personal Care Products (PPCPs)**

These parameters detect various compounds found in common personal care products, as well as medications and household items. The primary value in this sample group is the conclusiveness of the data. Because the detection limits are low and the percent of detections (at low concentrations) to date high, this sample program appears to provide the most conclusive evidence of anthropogenic impacts on the aquifer. The current sampling budget allows for nine wells, six springs, and two surface waters to be sampled annually for these parameters. The same locations are sampled each year (with some exceptions) to provide a temporal record of water quality changes associated with the compounds. This program is being evaluated for an increase in sample frequency at some locations.

### **5. Contingency Samples**

Contingency samples are collected only on an as-needed basis to assess potential contamination events related to spills or similar contingencies that have a high potential for affecting water quality in the Edwards Aquifer. Sample parameters and sample frequency are determined on the basis of type of spill (or other contingency), as well as the size of the event. Sample parameters and frequency are decided on by management. EAA staff members are subsequently directed to an appropriate course of action on the basis of assessment of the event by management.

### **6. Confirmation Samples**

Confirmation samples are samples collected in response to an unexpected detection at a site where additional confirmation is needed in order to assess the probability that detection is not a sampling artifact or otherwise false detection. Confirmation detections are method and analyte specific and are taken at the direction of management.

**7. QA/QC Samples**

QA/QC samples are discussed in detail in Section 3.3.

**Sample Programs for Sediment Sample Types****1. EAHCP Sediment Samples**

EAHCP sediment samples will be collected for a broad spectrum of parameters to establish a base-line data set for sediments in and around Comal and San Marcos springs. These sample data are important to an understanding of potential issues with disturbing sediments in these areas.

**2. Contingency Samples**

Contingency samples are collected only on an as-needed basis to assess potential contamination events related to spills or similar contingencies that have a high potential for affecting water quality in the Edwards Aquifer. Sample parameters and sample frequency are determined on the basis of type of spill (or other contingency), as well as the size of the event. Sample parameters and frequency are decided on by management. EAA staff members are subsequently directed to an appropriate course of action on the basis of assessment of the event by management.

**3. Confirmation Samples**

Confirmation samples are samples collected in response to an unexpected detection at a site where additional confirmation is needed in order to assess the probability that detection is not a sampling artifact or otherwise false detection. Confirmation detections are method and analyte specific and are taken at the direction of management.

**4. QA/QC Samples**

QA/QC samples are discussed in detail in Section 3.3

**Sample Programs for Stormwater Sample Types****1. EAHCP Stormwater Samples**

EAHCP stormwater samples are collected twice annually for a broad spectrum of parameters to establish a base-line data set for stormwater quality in and around Comal and San Marcos springs. Stormwater samples are collected across the hydrograph at three points (rising, peak, and recession) to ascertain changes in water quality associated with storm flow.

**2. Confirmation Samples**

Confirmation samples are samples collected in response to an unexpected detection at a site where additional confirmation is needed in order to assess the probability that detection is not a sampling artifact or otherwise false detection. Confirmation detections are method and analyte specific and are taken at the direction of management.

**3. QA/QC Samples**

QA/QC samples are discussed in detail in Section 3.3

**3.3 QUALITY CONTROL AND QUALITY ASSURANCE SAMPLES (QA/QC)**

So that the data quality process is adhered to, additional samples for QA/QC must be taken and analyzed on occasion so that the quality of the sample collection and analysis process might be assessed. The various types of QA/QC samples applicable to this plan are outlined in the following paragraphs. Approximately ten percent of all samples will be QA/QC samples.

**3.3.1 Matrix Spike and Matrix Spike Duplicate**

Matrix spike and matrix spike duplicate samples (MS/MSD) are used to assess the effects of the sample matrix on the analytical process. The MS/MSD is a split (or replicate) of a parent sample collected in the field concurrently during the normal sample-collection process. Ideally, one MS/MSD is collected for each media type (soil, water, sludge, etc.) every 20 samples for each analysis being performed. For most sampling, no media changes will be encountered; i.e., most samples will be water. However, should the samples vary significantly in turbidity, collection of a specific MS/MSD for a sample with elevated turbidity may be advisable.

The MS/MSD is spiked and analyzed, and if the spiked analytes are recovered within a method-specific percentage, then matrix effects will be deemed minimal and no matrix data flag will be attached to the results. However, if spike recovery does not fall within the designated percentage, then analytical results will be flagged with an M-flag, indicating that a matrix effect is present. The sample name for MS/MSDs is identical to that of the parent sample, with the MS/MSD attached as a modifier at the end of the sample name. The MS/MSD will also be noted on the chain of custody (COC).

**3.3.2 Ambient Blanks**

Ambient blanks are taken to assess the possibility of site-specific atmospheric contamination of VOC samples. Ambient blanks are taken only when an area is suspected of having detectable quantities of atmospheric VOCs present (e.g., if VOC samples are being collected near a fueling operation). Ambient blanks are prepared by pouring ASTM

II, reagent-grade water directly into a 40-milliliter (mL), VOA container at the sample site during collection. The VOA is allowed to remain open and exposed to the atmosphere for the duration of the sample-collection process. The water is treated and analyzed as a sample from this point forward, with the designation *AB* on the COC. Ambient blanks are applicable to VOC samples.

### 3.3.3 Equipment Blanks

Equipment blanks consist of ASTM II, reagent-grade water poured over/through any sampling equipment used for collection of definitive samples. Most sample-collection equipment is disposable; however, in some cases, an equipment blank may be required. Equipment blanks are used to assess the effectiveness of decontamination procedures (for new materials provided to the EAA or from EAA decontamination processes) and are designated as *EB* on the COC. The frequency of collection of equipment blanks will depend on the sampling routine and sampling equipment in use.

### 3.3.4 Trip Blanks

Trip blanks are applicable only to VOC samples and are prepared and supplied by the contracted analytical laboratory. Trip blanks are to be shipped from the laboratory and maintained along with the VOC samples collected in the field. The purpose of trip blanks is to assess any potential contamination that may be introduced during shipping and sample handling. Trip blanks are designated on the COC as *TB*. Trip blanks are not to be opened in the field.

### 3.3.5 Duplicate or Replicate Samples

Duplicate and replicate samples are intended to assess the precision or repeatability of the analytical process. Typically one in ten samples should have a duplicate sample collected. The collection frequency of one duplicate per ten samples is generally acceptable. Note, however, that if a confirmation sampling event involves only three wells, then the duplicate (as well as other) QA/QC samples are still required. In other words, duplicates compose 10% of the sample set such that a sample population of ten would contain one duplicate. However, a sample population of 11 would contain two duplicates. The calculated number of duplicates is always rounded to the next whole number. Duplicates will generally be collected only at the 10% level for EAHCP analysis. For other programs, duplicate analysis is covered generally by the application of a TWDB sample set. Exceptions may apply and will be designated by management.

A duplicate sample is a second sample collected at the same location as that of the parent, either simultaneously or immediately following collection of the first sample (AFCEE, 2001). Both samples are collected, stored, and transported identically. A replicate sample, sometimes called a *split sample* is defined as a single sample divided into two samples (AFCEE, 2001). As with a duplicate, collection, storage, and transport of the resulting

samples must be identical. Duplicate and replicate samples each have unique identifiers (see Section 4).

### **3.3.6 Spike Samples**

Spike samples are used as part of EAA's quality control on the contracted laboratory. EAA sampling staff members collect and subsequently spike twelve liters of water at one of the major springs, the spike containing a known percentage of a substance (contaminant). The spiked sample is then submitted to the contracted laboratory for analysis. If the contracted laboratory reports the findings within the specified amount, then EAA has confidence in their data. However, if the contracted laboratory is unable to detect or report the spikes, then EAA will pursue corrective action with the help of laboratory personnel to resolve the discrepancy. The corrective-action process will be initiated by the Hydrogeology Supervisor.

### **3.3.7 Recording QA/QC Samples in Analytical Workbook**

Samples collected for QA/QC or spiked samples are to be recorded in chronological order in the laboratory notebook. The laboratory notebook is to be kept in the EAA Camden Building in the water quality area with the calibration notebook.

**SECTION 4****ANALYTICAL METHODS, SAMPLE IDENTIFICATION, AND CUSTODY PROCEDURES**

This section will discuss analytical methods applicable to the EAA sampling program, as well as provide a summary of analytical hold times, acceptable sample containers, and preservation techniques. In addition, a discussion of proper identification and sample custody procedures is provided herein.

**4.1 ANALYTICAL METHODS**

A variety of analytical methods are used in the various water quality and sediment sampling programs. Table 4-1 lists standard analytical reference methods that have possible application to the various programs. Recall, too, that Table 3-1 provides a current listing of analytical methods/parameters for each sample type and program.

**Table 4-1. Analytical Reference Methods**

<b>Analysis</b>	<b>Method</b>
VOC	SW-8260b
SVOC	SW-8270c
Chlorinated herbicides	SW-8151a
Organophosphorus compounds	SW-8141a
Nonvolatile compounds by HPLC	SW-8321
Organochlorine pesticides	SW-8081b
Polychlorinated biphenyls (PCBs)	SW-8082a
PAH	SW-8310
Determination of triazine pesticides	EPA-619
Organonitrogen pesticides in industrial/municipal wastewater	EPA-633
Oryzalin in industrial/municipal wastewater	EPA-638
TPH	TX-1005
Metals (except mercury)	SW-6010b or SW-6020
Mercury	SW-7470A
Cyanide	SW-9010B

**Table 4-1. Analytical Reference Methods (continued)**

<b>Analysis</b>	<b>Method</b>
Alkalinity	EPA-310.1
Common anions	SW-9056

General water quality parameters (GWQP), general chemistry—(alkalinity, bicarbonate, carbonate, Ca, Mg, Na, K, Cl, SO <sub>4</sub> , F, Si, Sr, bromide, nitrate as N, pH, TDS, and TSS)	Methods listed in table

## 4.2 DATA-FLAGGING CONVENTIONS

Analytical data must be qualified by the EAA-contracted analytical laboratory, which is done summarily by the addition of data flags to the data result. Table 4-2 provides a summary of the data-flagging convention used in this plan (modified from AFCEE, 2001).

**Table 4-2. Data Flags**

<b>Flag</b>	<b>Description</b>
J	Analyte positively identified. Quantitation is an estimation because the associated numerical value is below the reporting limit (RL).
U or ND	Analyte analyzed for, but not detected. Associated numerical value at or below method detection limit (MDL).
R	Data rejected because of deficiencies in ability to analyze sample and meet QC criteria.
B	Analyte found in associated blank, as well as in sample.
M	Matrix effect present.
T	Tentatively identified compound (using GC/MS).
No flag	Analyte detected at reported concentration.

## 4.3 SAMPLE CONTAINERS AND HOLD TIMES

Samples sent to the analytical laboratory must be properly containerized, preserved, and analyzed within specified hold times for the method for the data to be of defensible quality. In addition to the requirement for samples to be chilled to 4°C, ±2°, some analytical methods require the sample to be maintained at specific pH values. As such, Table 4-3 lists acceptable container types, preservatives, and hold times for common analytical methods. The table includes all scheduled analyses for the various sampling programs. In the event an analysis is required that is not included in the table, Aquifer Science Team members listed herein (hydrogeology supervisor or hydrologic data coordinator) will communicate with the EAA contracted laboratory regarding appropriate containers, preservatives, and hold times for the methods in question.

**Table 4-3. Sample Containers, Preservatives, and Hold Times**

Analyte or Method <sup>1</sup>	Container	Preservation	Minimum Sample Volume	Holding Times
Volatile organic compounds (SW8260B)	G, Teflon®-lined septum, T	4°C, HCl to pH <two	3× 40 mL with no head space or (1) 250 mL amber bottle with no head space	14 days (water and soil); seven days if unpreserved by acid
Semivolatile organic compounds (SW8270C)	G, Teflon®-lined cap, T	4°C	1L or 8 ounces/soil	Seven days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)
Chlorinated herbicides (SW8151a)	G, Teflon®-lined cap, T	4°C	1L or 8 ounces/soil	Seven days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)
Organophosphorus compounds (SW8141A)	G, Teflon®-lined cap, T	4°C	1L or 8 ounces/soil	Seven days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)
Organochlorine pesticides (SW8081)	G, Teflon®-lined cap, T	4°C	1L or 8 ounces/soil	Seven days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)
Polychlorinated biphenyls (SW8082)	G, Teflon®-lined cap, T	4°C	1L or 8 ounces/soil	Seven days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)

*Section 4*

Analyte or Method <sup>1</sup>	Container	Preservation	Minimum Sample Volume	Holding Times
Polynuclear aromatic hydrocarbons (SW8310)	G, Teflon®-lined cap, T	4°C	1L or 8 ounces/soil	Seven days until extraction and 40 days after extraction (water); 14 days until extraction and 40 days after extraction (soil)
Total petroleum hydrocarbons (TX1005)	G, Teflon®-lined septum, T	4°C, HCl to pH <2	3× 40 mL with no head space or (1) 250 mL amber bottle with no head space	14 days (water); to extraction, and 14 days after extraction
General water quality parameters (alkalinity, bicarbonate, carbonate, Ca, Mg, Na, K, Cl, SO <sub>4</sub> , F, Si, Sr, bromide, nitrate (as N), pH, TDS, and TSS)	P, G	4°C	250 mL	28 days
Cyanide	P, B	4°C; NaOH to pH >12	500 mL or four ounces /soil	14 days (water and soil)
Ortho-phosphate (as P)	P, G	4°C	50 mL	48 days
Nitrate (as N) and nitrite (as N)	P, G	4°C	250 mL	48 days
Ammonia (as N)	P, G	4°C	250 mL	28 days
Kjeldahl (as N)	P, G	4°C	250 mL	28 days
Total organic carbon	P, G	4°C, H <sub>2</sub> SO <sub>4</sub> to pH <2	250 mL	28 days
Dissolved organic carbon	P, G	4°C, H <sub>2</sub> SO <sub>4</sub>	400 mL	28 days
Phosphorus	P, G	4°C, H <sub>2</sub> SO <sub>4</sub>	500 mL	28 days
Alkalinity E310.1	P, G	4°C	50 mL	14 days
Common anions SW9056	P, G	None required	50 mL	28 days for Br <sup>-</sup> , F <sup>-</sup> , Cl <sup>-</sup> , and SO <sub>4</sub> <sup>2-</sup> ; 48 hours for NO <sub>3</sub> <sup>-</sup> , NO <sub>2</sub> <sup>-</sup> , and PO <sub>4</sub> <sup>3-</sup>
Cyanide, total and amenable to chlorination SW9010A SW9012	P, G, T	4°C; NaOH to pH >12, 0.6 g ascorbic acid	500 mL or four ounces /soil	14 days (water and soil)
Total dissolved solids (TDS) E160.1	P, G	4°C	100 mL	Seven days
Total suspended solids (TSS) E160.2	P, G	4°C	100 mL	Seven days
Biological oxygen demand (BOD), five-day	P, G	4°C	1L	48 hours
Sulfide	P, G	4°C	1L	Seven days

*Section 4*

Analyte or Method <sup>1</sup>	Container	Preservation	Minimum Sample Volume	Holding Times
Total inorganic carbon	P, G	4°C	250 mL	28 days
Escherichia coli-colilert	P, G, WP	4°C, dark, sodium thiosulfate, one-inch headspace	100–250 mL	Six + two h (this holding time represents six field hours and two lab hours)
Enterococci	P, G, WP	4°C, dark, sodium thiosulfate, one-inch headspace	100–250 mL	Six + two h (this holding time represents six field hours and two lab hours)
Total coliform-colilert	P, G, WP	4°C, dark, sodium thiosulfate, one-inch headspace	100–250 mL	Six + two h (this holding time represents six field hours and two lab hours)
TWDB anions	P, G	4°C, filtered on site	500 mL	28 days
TWDB cations	P, G	4°C, HNO <sub>3</sub> , filtered on site	250 mL	28 days
TWDB nitrate	P, G	4°C, H <sub>2</sub> SO <sub>4</sub> , filtered on site	500 mL	28 days
1694 Pharmaceuticals (LCMS/MS) Acetaminophen Caffeine Carbamazepine Cotinine DEET Diltiazem Fluoxetine Gemfibrozil Ibuprofen Lincomycin Naproxen Sulfamethoxazole Trimethoprim Tylosin Iopromide	G, Teflon®-lined cap, T	4°C	1L or 8 ounces/soil	Seven days (unpreserved), 14 (days preserved)
1694 Antibacterial (LCMS/MS) Triclobarban Triclosan	G, Teflon®-lined cap, T	4°C	1L or 8 ounces/soil	Seven days (unpreserved), 14 (days preserved)

Section 4

Analyte or Method <sup>1</sup>	Container	Preservation	Minimum Sample Volume	Holding Times
1698 Steroids/hormones (LCMS/MS) 17a-Estradiol 17a-Ethynyl estradiol 17b-Estradiol Equilenin Estriol Estrone Progesterone Testosterone	G, Teflon®-lined cap, T	4°C, H <sub>2</sub> SO <sub>4</sub>	1L or 8 ounces/soil	Seven days (unpreserved), 14 (days preserved)
Nonylphenols/ethoxylates/bisphenol-A (GCMS) Bisphenol-A Nonylphenol diethoxylate (tech.) Nonylphenol monoethoxylate (tech.) p-Nonylphenol (tech.) p-tert-octylphenol para-n-nonylphenol	G, Teflon®-lined cap, T	4°C, H <sub>2</sub> SO <sub>4</sub>	1L or 8 ounces/soil	Seven days (unpreserved), 14 (days preserved)
Selected metals—6020 (Al, Sb, As, Ba, Be, Cd, Cr (total), Cu, Fe, Pb, Mn, Hg, Ni, Se, Ag, Tl, and Zn)	P, G, T	HNO <sub>3</sub> to pH <2, 4°C	500 mL or 8 ounces/soil	180 days (water and soil)
Hg—Cold vapor 7470.7471	P, G	HNO <sub>3</sub> to pH <2, 4°C	250 mL	28 days (14 days if in plastic bottle)
Selected metals—(ICP unless otherwise noted) 6020/7470/7471 (Al, Sb-ICP-MS or GFAA, As, Ba, Be, Cd, Cr (total), Cu, Fe, Pb, Mn, Hg-ICP-MS or CVAA, Ni, Se-ICP-MS or GFAA, Ag, Tl-ICP-MS or GFAA, and Zn)	P, G, T	HNO <sub>3</sub> to pH <2, 4°C	500 mL or 8 ounces/soil	180 days (water and soil)
Hg- ICP-MS or CVAA <b>7470/7471</b>	P, G	HNO <sub>3</sub> to pH <2, 4°C	250 mL	28 days (14 days if in plastic bottle)

- Polyethylene (P); glass (G); brass sleeves in sample barrel, sometimes called California brass (T).
- No pH adjustment for soil.
- Preservation with 0.008 percent Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> only required when residual chlorine present.

## 4.4 SAMPLE IDENTIFICATION

Each sample must have a unique identifier so that it can be differentiated from other samples. In addition, sample names must meet the required criteria for entry into the data base and subsequent electronic storage and retrieval of the data. Therefore, sample names must conform to the guidelines herein.

### 4.4.1 Sample Identification, for Non-EAHCP Samples

The primary method for non-EAHCP sample identification will be to use the state well registration number for wells (and springs as applicable) or the site name for surface water samples. When no well number is available for a spring, then an abbreviation for the spring name and orifice will be used. For example,

- The unique identifier, for use on the COC for Comal Springs, Orifice 1 is DX 68-23-301,
- The unique identifier for use on the COC for Comal Springs Orifice 3 (no state well number) is CS3,
- The unique identifier for use on the COC for the Nueces River at Laguna is Nueces@Laguna, and
- For wells that are sampled in more than one location within the borehole, the interval number is attached to the well name. For example, well LR-67-09-101 is regularly sampled at two intervals, so the COC name is LR-67-09-101-1 (interval 1 or upper interval) and LR-67-09-101-4 (interval 4, or the deepest interval).

Note that to the extent possible, custody forms and sample-container labels will be preprinted by the laboratory.

In some cases no well number or other recognized registration number will exist for the sample point. Then documentation for the sample location will require location (latitude/longitude and address if available) and name of well owner. Photographic documentation is also required. The subsequent sample name will be a *pseudo* state well number derived from the well location and owner name. For example,

The unique identifier for a sample taken from the Mary Smith residence in San Antonio, a private well with no state well registration number and located in Bexar County (abbreviation AY) at state well grid location 68-23-8, would be AY-68-23-8MS.

When wells of this type are sampled, proper documentation to include collection location, sample name, sample parameters, date, and time is extremely important and will be recorded in the field log for cross reference to the COC.

#### 4.4.2 Sample Identification, for EAHCP Samples

For samples collected under the EAHCP, sample names are designed to provide additional data regarding sample type. Specifically the sample name will indicate the sample as an EAHCP-related sample, the spring group (Comal or San Marcos), sample type (surface water, stormwater, or sediment), and sample location. In the example below, the sample name refers to an EAHCP sample at Comal Springs, collected for surface water, at location 10. Sample locations are noted on the sample-collection maps for the EAHCP (included in Appendix A with calendar year 2013 non-EAHCP sample locations).

#### 4.4.3 Sample Identification, QA/QC

For QA/QC samples, a modifier is added to the sample name to indicate the QA/QC type, for example, DX-68-23-301 (Comal Spring 1). If an MS/MSD sample were collected, a separate set of samples named DX-68-23-301MS/MSD would be collected. The appropriate modifier for each QA/QC sample is listed in Table 4-4.

**Table 4-4. QA/QC Sample Nomenclature**

Sample Type	Modifier
Matrix spike/matrix spike duplicate	MS/MSD*
Ambient blank	AB <sup>#</sup>
Equipment blank	EB <sup>#</sup>
Trip blank	TB <sup>#</sup>
Duplicate	FD*
Replicate	FR*

\* Requires sample, with same sample name as parent + modifier at end.

<sup>#</sup> Numerical suffix to be attached and referenced in laboratory notebook; suffix starts at 1 at beginning of each calendar year. Details for location, etc. included in field notebook documentation.

#### 4.5 SAMPLE CUSTODY

All samples shipped to the analytical laboratory must have proper custody documentation. One person on each sampling team is to have primary responsibility for sample custody (generally the lead sampler). This person will be designated as the *sample custodian* for sample collection. A person has custody of a sample group if samples are (1) in his/her possession, (2) in his/her view after being in his/her possession, (3) placed in a secure area by the sample custodian.

Furthermore, the laboratory COC form is to be filled out completely by the sample custodian in the field. The form must contain all required information for proper sample identification (if not preprinted) and must contain appropriate signatures. In addition, samples must remain in control of the sample custodian. Once collected, samples must be under the supervision of the sample custodian or secured in a manner such that no reasonable chance of unauthorized access to the samples exists. Furthermore, samples shipped by a common courier (i.e., Federal Express), require that the sample custodian note on the COC when the samples were released to the courier and why. The contracted analytical laboratory will sign the COC upon receipt. A breach of sample custody can invalidate the defensibility of the sample set.

#### 4.6 DATA VALIDATION

Analytical data require review in order to be validated prior to publication. The amount of review (or level of review) is a function of the sample type. Field-collected data results are reviewed in the field by the analyst. One of the best ways for the field analyst to assess the acceptability of field data and subsequently validate them is to compare the results with historical data. This comparison, combined with proper equipment calibration, maintenance, and analytical technique, will provide an adequate validation process for field-parameter data. In the event that the analyst finds a discrepancy in the field data, a second analysis for the parameter in question should be performed. If the analyst feels that the data may be inaccurate because of issues with the field analysis, this fact is to be noted on the sample field sheet.

Contract analytical-laboratory data will receive a 100% analyst review at the analytical laboratory prior to posting of analytical results. A subsequent analytical laboratory review by the QA/QC section is required prior to the analytical laboratory's certification of the results. A subsequent 10% review by EAA staff of the analytical data is required upon receipt of the final analytical report. The analytical report will contain numerical analytical results for the laboratory QA/QC samples (i.e., LCS, method blanks, etc.). These laboratory analytical data are to have data flags assigned by the analytical laboratory.

## **SECTION 5**

### **FIELD PROCEDURES AND SAMPLE COLLECTION**

Possibly the most significant part of any successful sample collection is the field procedures and documentation that occur in the field. Field procedures to include sample equipment decontamination; sample-collection procedures for well, spring, surface water, and sediment samples; a listing of potential sources of contamination; and the proper use of field notebooks are included in this section.

#### **5.1 RESPONSIBILITIES**

The CTO and hydrogeology supervisor for the data-collection program will ensure that the samples obtained represent the environment being investigated. The hydrologic data coordinator will ensure that all field crews are provided with the necessary information, equipment, and supplies to successfully schedule and complete sampling. The hydrologic data coordinator will also be the primary point of contact between the contract analytical laboratory project manager and the EAA sampling team(s). The hydrologic data coordinator will report sampling deviations to the CTO and hydrogeology supervisor. Sample-collection staff (generally, environmental science technicians) are responsible for being familiar with the instructions provided in this SOP and for collection of samples in accordance with this SOP. For most sample-collection events, a sample team of two people will be utilized. Teams will have a lead sampler (according to experience level) who is directly responsible for adherence to directives of the SOP.

#### **5.2 EQUIPMENT DECONTAMINATION**

In order to obtain samples that are reliable and defensible, all (nondisposable) sample-collection equipment must be decontaminated prior to use. When possible, sample collection from a wellhead valve directly to a sample container is best. When this kind of collection is not possible, disposable equipment is preferable.

If neither option is plausible, then nondisposable sample-collection devices (constructed of Teflon® when possible) must be used. Sampling equipment that is exposed directly to sample media (pumps, peristaltic or submersible pump tubing, reusable bailers, or other devices) will be washed in a nonphosphate, laboratory-grade detergent such as Alconox®, followed by a double rinse in potable water. A final rinse of deionized or distilled water will be applied after completion of the initial decontamination process.

Equipment that will not be used immediately must be kept clean by wrapping in aluminum foil or placed inside clean plastic bags. Such storage will prevent

contamination of the equipment prior to use. See Appendix G for additional detail regarding equipment-decontamination procedures.

### 5.3 SOURCES OF SAMPLE CONTAMINATION

Samples can easily become contaminated during the sample-collection process. It is the responsibility of the sampler to prevent contamination from occurring. A multitude of potential cross-contamination sources are present in the field environment. Because many of the analytical methods used can quantify various analytes in parts per billion or less, even minute sources can potentially contaminate a sample. For example, Table 5-1 summarizes some of the potential sources that can cause a false-positive reading in a sample. These should be considered when samples are collected in the field. Also note that water has a strong affinity for many anthropogenic compounds. Use of good judgment is another aspect of collecting defensible data. Steps should be taken to avoid cross-contamination of samples. If the sampler suspects the possibility of cross-contamination, he/she should note it in the field log for the sample set in question, or the site should be sampled again if necessary.

**Table 5-1. Potential Sources of Cross-Contamination**

Source	Possible Contaminant
Fuels—generators, work vehicles	BTEX/TPH/VOC/SVOC
Exhaust fumes—generators, vehicles, heavy roadway traffic, overhead air traffic	BTEX/TPH/VOC/SVOC
Oil/grease residue on tools, gloves, etc.	TPH/SVOC
Tape	VOC
Insect spray	VOC/SVOC/pesticides
Insect repellent	SVOC/VOC/pesticides
Sunscreen	VOC/SVOC/PPCP
Soil/debris	Bacteriological/metals/SVOCs
Foods/drinks/medications and other personal care products such as soap, makeup, deodorant, etcetera.	PPCPs

## 5.4 FIELD NOTEBOOKS

The field notebook is a legal document and should be treated as such. All pertinent site information should be in the notebook, including site name, weather information, site conditions, well condition (if applicable), equipment problems, sample-collection notes such as approximate sample times, and any other information that may be deemed valuable. The names of individuals on the sample team, as well as visitors to the site, should also be recorded in the notebook. All information recorded in the field notebook should follow the format described herein. No blank spaces are to be left on pages. All blank areas should be marked through with a single line and initialed by the author. The top of each page should have the date and sample site. The base of each page should contain the initials of the author. Mistakes are to be crossed out with a single line and initialed. Field notebooks are to be recorded in black ink only.

## 5.5 SAMPLE COLLECTION

Field personnel must wear clean (disposable) nitrile gloves during the sample-collection process. Generally samples for field water quality parameters are to be collected first, followed by VOC, SVOC, and metals samples. Any required information is to be recorded in the field notebook before, during, and after sampling.

### 5.5.1 Well Samples

Each well must be gauged and sounded (if possible). The general condition of the well will be noted in the field notebook. After the water level is gauged, the purge volume for the well will be calculated by the following equation,

$$V = H \times F,$$

where V is one well volume, H is the difference between depth of the well and depth to water in feet (i.e., length of water column in well), and F is the number of gallons per foot of water for the well size (Table 5-2).

**Table 5-2. Well-Casing Volume in Gallons per Foot**

Casing Diameter (in inches)	F (gallons per foot of water in well)
2	0.16
4	0.65
6	1.47
8	2.6
10	4.1
12	5.9
16	10.4

The relationship  $F = \pi (D/2)^2 \times 7.48$  gallons/ft<sup>3</sup> can be used to calculate pipe volumes not listed in the table. Note that D = pipe diameter in feet and F = volume per foot.

A well may be sampled upon achieving *one* of the following: a minimum of three well volumes are purged from the well or field-parameter readings are stabilized for a minimum of three parameter measurements. Wells that go dry prior to purging the three well volumes, or the field-parameter readings have not stabilized, shall be purged to dryness (except for drinking-water supply or irrigation wells). During purging, water will be monitored for the following field parameters: *temperature, pH, DO, conductivity, and turbidity*.

Stabilization is defined as

- Temperature fluctuations limited to  $\pm 1^\circ \text{C}$ ,
- pH fluctuations  $\pm 0.1$  unit,
- DO fluctuations  $\pm 0.3$  milligrams per liter (mg/L),
- Conductivity fluctuations  $\pm 5\%$ , and
- Turbidity  $\pm 10$  NTU.

In the event that these parameters do not stabilize (after purging of three well volumes), a maximum of six well volumes will be purged prior to sample collection (if the field parameters stabilize at any point, the well is considered ready to sample, and purging may cease). Once the well has stabilized or the maximum purge volume is reached, and the well has recovered to at least 80% of its initial level, it is ready to sample.

### 5.5.2 Spring Samples

Springwater samples should be as representative of the actual water issuing forth from the spring as possible and not be “contaminated” by surrounding surface waters. As such, various sample-collection techniques may be necessary. For spring orifices located below surface water, samplers should use a peristaltic pump to collect the springwater sample by placing the intake part of the pump tubing in the spring orifice. This placement allows for filling of sample bottles without introducing surface waters or overflowing the bottles and losing any preservatives inside. This technique is not feasible or necessary for all spring sites but should be utilized as appropriate. When a spring that can be sampled without a pump is being sampled, then a typical grab sample may be collected. In some cases (high flow volume) it may be necessary to collect samples in a clean bottle (such as a clean 1,000-mL amber glass bottle, clean Teflon beaker, or something similar) and the container used to transfer water into subsequent containers. Doing so will prevent the loss of any preservatives that may be in sample bottles. However, the action should be performed with as little agitation to the sample as possible to preserve potential VOCs in the parent sample.

Note: If preservatives in the sample container are diluted or lost because of the collection technique, a new bottle should be used. If a new bottle is unavailable, the lack of preservatives must be communicated to the laboratory to ensure that the sample remains valid by being analyzed within the appropriate hold time.

Current information and observations concerning springflow at the time of sample collection should be entered in the field notebook. For example, approximate springflow volume (can be listed as low, medium, high) is the flow representative of an extreme volume (high or low); observed water quality should be noted (clear, cloudy, or murky), along with other observations deemed appropriate by the lead sampler.

### **5.5.3 Surface Water Samples**

Surface water samples should be collected without disturbing the sediment, if at all possible. The presence of sediment in the sample may bias the results. Samples should be collected from the flowing parts of the stream on the upstream side of the sample collector. Samples are not to be collected from stagnant areas, and they should also be taken from approximately the same location for each sample event. Sample bottles should be filled by collecting the water sample in a clean bottle or by using a peristaltic pump and transferred into the final sample bottle. Caution should be used to prevent overfilling of the sample bottle and diluting any preservatives that may be in the bottle.

Note: If preservatives in the sample container are diluted or lost because of the collection technique, a new bottle should be used. If a new bottle is unavailable, the lack of preservatives must be communicated to the laboratory to ensure that the sample remains valid by being analyzed within the appropriate hold time.

Information regarding the sample point in the stream, streamflow, and water conditions, as well as other information deemed appropriate by the sampler, should be entered into the field notebook at the time of sample collection.

### **5.5.4 Sediment Samples**

Sediment samples are scheduled for collection by the EAHCP sampling program. Furthermore, the possibility exists that EAA staff may be required to collect samples of this type on occasion for other programs. As such, a brief discussion of this type of sample is included herein. Sediment samples may be collected from below the water line, from a dry stream bed, or from any other source in which sediments or soils may collect. The collection technique will depend on conditions. For example, a push tube for collection of sediments below the water surface is generally needed. However, if sediments are being collected from a dry area, then they may be collected using a trowel, hand auger, or push tube of some type. As with all sediment/soil-related samples, VOC samples must be collected in a manner that will minimize the loss of in situ volatiles. As

such, sediment samples for VOC analysis will not be composited or homogenized in the field. Samples for VOC analysis are to be collected first.

In the event that the discreet-interval sediment sampler is used for collection of sediments, the procedure for device operation is as follows:

1. Insert the lower-half of the lead internal rod using a  $\frac{3}{8}$ -inch coupler (first stage) into the internal drive tip. Pull down on the brass ring, push the grooved end of the lead internal rod into the recess, and gently release the brass ring.
2. Insert the internal drive tip and lead internal-rod assembly into the external drive tip.
3. Connect the upper lead internal rod using the  $\frac{3}{8}$ -inch coupler (second stage) to the lower lead internal rod (first stage).
4. Insert a four-ft liner, with the hole in the liner oriented to the top, into the sample tube (the sample tube has a two-inch outside diameter and consists of two parts, a double female lead section and a male  $\times$  female extension). If the EAA staff chooses to use a two-ft liner instead of a four-ft liner, the process is the same, except that the male  $\times$  female upper extension is not used.
5. Insert a plastic core catcher (white) in the bottom of the sample tube, with the dome pointing toward the top.
6. Insert the internal drive tip/external drive tip assembly into the sampler tube.
7. Insert the metal core catcher into the top of the main sampler tube, with the dome pointing upward.
8. Install the internal tip chamber to the top of the main sampler tube.
9. Install the top drive head adapter to the top of the internal tip chamber.
10. Install the thread protector cap or internal rod with external drive extensions (if using  $1\frac{1}{8} \times 3$  ft external extensions with  $\frac{3}{8}$ -inch internal rods, place a  $\frac{3}{8}$ -inch coupler on the top of the internal rods prior to installing the top drive head adapter). Install the thread protector cap at the top of the internal rod prior to connecting the vented drive head (install the correct number of internal/external extensions necessary to lower the sampler to the surface and arrive at the desired sampling point).
11. Install the vented hammer adapter, already attached to the slide hammer.

The field notebook will note details related to the sediment samples; for example, was the sediment dry or below water, how was it collected, was it discolored, at what depth (from the surface) was the sample collected? If sediments are field screened with a photoionization detector (PID), readings from the various intervals will be recorded. Other details will be recorded as deemed appropriate by the sampler.

Also, if a hand trowel is used, it must be constructed of stainless steel, and it must be decontaminated prior to each use. For sites at which multiple samples will be collected, multiple hand trowels may be used, or a single trowel may be used if it is decontaminated in the field (Alconox wash, double rinse in potable water, followed by a DI water rinse).

### **5.5.5 Stormwater Samples**

Stormwater samples are scheduled for collection under the EAHCP program at each spring group, twice annually. Stormwater sample collection offers additional challenges and safety issues, as compared with that of other samples collected under EAA programs. This section provides a general summary of stormwater sampling, additional detail regarding this sample type being provided in Appendix F.

Stormwater samples are scheduled for collection across three points on the storm hydrograph. One sample collected from the initial rise on the hydrograph, a second sample from the peak area of the hydrograph, and a final sample along the recession limb of the graph. In addition, water quality parameters obtained from EAA-installed real-time water quality monitors, flow data from the U.S.G.S. springs gauges, and local weather radar maps will be used to define the behavior of the systems and help guide sample-collection timing. The real-time monitors collect data at 15-minute intervals for conductivity, DO, pH, temperature, and turbidity.

A stormwater event will be dictated by a rainfall event sufficient to cause a significant rise in springflow at either Comal or San Marcos springs. The significant rise in springflow is to be further defined in conjunction with real-time data systems. See Appendix F for details on stormwater sampling procedures.

## **SECTION 6**

### **ANNUAL REVIEW OF PLAN**

#### **6.1 ANNUAL REVIEW OF GROUNDWATER QUALITY PLAN**

Data collection described in this plan will be reviewed by May 31 each year. The review will be directed at ensuring that all data collection herein is necessary, properly performed, and properly staffed. Furthermore, the review will ascertain whether the methodologies in use remain appropriate for their intended purpose. The review process will include all sample types and programs, as well as methods used to collect and analyze these samples.

Postreview, modifications will be made, if needed, to accommodate changes to EAA sampling. Changes will be initiated by the management and staff of the EAA Aquifer Science Team.

## **SECTION 7**

### **CONTINUING EDUCATION CREDITS FOR SAMPLE-COLLECTION PERSONNEL**

#### **7.1 CONTINUING EDUCATION**

Staff members assigned to sample-collection teams must attain a minimum of 12 hours of continuing education each year. Opportunities for continuing education will be provided either in-house by the EAA, or, in some cases, staff may be sent to an offsite facility to attend a class. One hour of credit is considered to be one classroom or contact hour. Staff may also carry credits over into the following year if more than 12 hours of credit are obtained in a calendar year. It is the responsibility of each staff member to document his/her credit hours annually and submit them to the hydrogeology supervisor by December 1 of each year.

**APPENDIX A—Sample Locations (2013)**

## **APPENDIX B—Glossary of Terms**

Ambient blank	Sample known not to contain target analytes, which are used to assess airborne contaminants at the site. The ambient blank [AB] is
---------------	--

	opened at the site and exposed to site (ambient) conditions and subsequently treated as an environmental sample thereafter. AB samples are applicable to VOC analysis only.
Anion	Negatively charged ion.
Aquifer	Underground geological formation or group of formations containing water; source of groundwater for wells and springs.
Cation	Positively charged ion.
DOC	Abbreviation for dissolved organic carbon, a broad classification of organic molecules of varied origin and composition within aquatic systems. Organic carbon compounds are a result of decomposition processes from dead organic matter, such as plants.
DQO	Abbreviation for data quality objectives, a process used to develop performance and acceptance criteria or data quality objectives that clarify study objectives, define the appropriate type of data, and specify tolerable levels of data needed to support decisions.
Equipment blank	Sample used to assess the effectiveness of the decontamination process on sampling equipment. The equipment blank is prepared by pouring reagent-grade water over/through sampling equipment and analyzing for parameters of concern (to match the sampling routine applicable to the site).
Field duplicate	Second sample collected simultaneously from the same source as the parent sample, but which is submitted and analyzed as a separate sample. This sample should generally be identified such that the laboratory is unaware that it is a field duplicate.
Field replicate	Sometimes referred to as a <i>split sample</i> , a single sample divided into two (or more) samples.
Groundwater	Water found beneath Earth's surface that fills pores between materials, such as sand, soil, or gravel.
Initial rise	Initial surface runoff of a rainstorm. During this phase, water pollution entering storm drains in areas with high proportions of impervious surfaces is typically more concentrated during first flush than it is during the remainder of the storm.

Matrix spike	Sample used to determine the effect of the matrix on a method's recovery efficiency. A known amount of the target analyte is added to a specified amount of matrix sample for which an independent estimate of the target analyte concentration is available. Duplicate samples must be available as well (matrix spike duplicate, or MSD).
MDL	Abbreviation for method detection limit, minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero, as determined from analysis of a sample containing the analyte in a given matrix.
Peak	Maximum instantaneous flow at a specific location resulting from a given storm condition.
PQL	Abbreviation for practical quantitation limit, which is the smallest concentration of the analyte that can be reported with a specific degree of confidence.
Precision	State or quality of being precise; exactness. The ability of a measurement to be consistently reproduced.
Purge	To remove standing water in a well.
Recession	End of runoff event, which is defined as the point in time when the recession limb of the hydrograph is <two% of the peak or is within ten % of the prestorm base flow, whichever is greater.
Recharge zone	Where an aquifer is replenished with water by the downward percolation of precipitation through soil and rock.
Representative	Said of samples collected that are similar to those of groundwater in its in situ condition.
RL	Abbreviation for reporting limit [RL], the smallest concentration of an analyte reported by the laboratory to a customer. The RL is never less than the PQL and is generally twice the MDL.
Spike sample	One of any known concentrations of specific analytes that have been added to minimize change in the matrix of the original

	sample. Every spike sample analyzed should have an associated reference to the spike solution and the volume added.
Spring	Water coming naturally out of the ground.
Surface water	That which forms and remains above ground, such as lakes, ponds, rivers, streams, bays, and oceans.
SVOC	Abbreviation for semivolatile organic compounds, which is a group of chemicals composed primarily of carbon and hydrogen that have a tendency to evaporate (volatilize) into the air from water or soil. Some of the compounds that make up asphalt are examples of SVOCs.
TDS	Abbreviation for total dissolved solids, or the total amount of all inorganic and organic substances, including minerals, salts, metal, cations, or anions that are dispersed within a volume of water.
Temporal	Over a period of time.
TKN	Abbreviation for total kjeldahl nitrogen, which is the total concentration of organic and ammonia nitrogen in wastewater.
TOC	Abbreviation for total organic carbon, which is the gross amount of organic matter found in natural water. Suspended-particulate, colloidal, and dissolved organic matter are part of the TOC measurement. Settable solids consisting of inorganic sediments and some organic particulate are not transferred from the sample by the lab analyst and are not part of the TOC measurement.
Trip blank	Sample known to be free of contamination (for target analytes) that is prepared in the laboratory and treated as an environmental sample after receipt by the sampler. Trip blank [TB] samples are applicable to VOC analysis only.
TSS	Abbreviation for total suspended solids, which are the nonfilterable residue retained on a glass-fiber disk filter mesh measuring 1.2 micrometers after filtration of a sample of water or wastewater.
VOC	Abbreviation for volatile organic compounds, which are often used as solvents in industrial processes and are either known or suspected carcinogens or mutagens. The five most toxic are vinyl

chloride, tetrachloroethylene, trichloroethylene, 1,2-dichloroethane, and carbon tetrachloride.

Well                      Bored, drilled, or driven shaft whose purpose is to reach underground water supplies.

## **APPENDIX C—Equipment Use and Calibration**

## DOCUMENTATION PROCEDURES

All equipment maintenance and calibration must be documented in the laboratory notebook kept at the EAA Camden Building. This documentation is an important part of ensuring that data-collection results are “defensible.” Calibration details, equipment type, date, calibration statement, and sampler’s signature must appear in the book for each day that the equipment is used.

EAA currently uses the YSI 556 MPS field instrument to collect pH, DO, conductivity, and temperature at each sample point. Calibration procedures for this instrument are detailed next.

## CALIBRATION PROCEDURES

### Calibration Procedures for YSI 556 MPS

#### Accessing the Calibrate Screen

1. Press the **On/Off** key to display the run screen.
2. Press the **Escape** key to display the main menu screen.
3. Use the arrow keys to highlight the **Calibrate** selection

Figure 6.1 Main Menu

4. Press the **Enter** key. The Calibrate screen will be displayed.

Figure 6.2 Calibrate Screen

## Conductivity Calibration

This procedure calibrates specific conductance (recommended), conductivity, and salinity.

Calibrating any one option automatically calibrates the other two.

1. Go to the Calibrate screen
2. Use the arrow keys to highlight the **Conductivity** selection.
3. Press **Enter**. The Conductivity Calibration Screen is displayed.

## Conductivity Calibration Selection Screen

4. Use the arrow keys to highlight the Specific Conductance selection.
5. Press **Enter**. The Conductivity Calibration Entry Screen is displayed.

## Conductivity Calibration Selection Screen

6. Place the correct amount of conductivity standard into a clean, dry or pre-rinsed transport/calibration cup.

**WARNING:** Calibration reagents may be hazardous to health. See information on label.

**NOTE:** For maximum accuracy, the conductivity standard you choose should be within the same conductivity range as the samples you are preparing to measure. However, we do not recommend using standards less than one mS/cm. For example:

- For freshwater use a one-mS/cm conductivity standard.
- For brackish water use a ten-mS/cm conductivity standard.
- For seawater use a 50-mS/cm conductivity standard.

**NOTE:** Before proceeding, ensure that the sensor is as dry as possible. Ideally, rinse the conductivity sensor with a small amount of standard that can be discarded. Be certain that cross-contamination of solutions be avoided. Make certain that no salt deposits are around the oxygen or pH/ORP sensors, particularly if standards of low conductivity are being employed.

7. Carefully immerse the sensor end of the probe module into the solution.
8. Gently rotate and/or move the probe module up and down to remove any bubbles from the conductivity cell.

**NOTE:** The sensor must be completely immersed past its vent hole. Using the recommended volumes and ensure that the vent hole is covered.

9. Screw the transport/calibration cup onto the threaded end of the probe module and securely tighten.

**NOTE:** Do not over tighten because doing so could damage the threaded parts.

10. Use the keypad to enter the calibration value of the standard being used.

**NOTE:** Be sure to enter the value in **mS/cm at 25°C**.

11. Press **Enter**. The Conductivity Calibration Screen is displayed.

**Conductivity Calibration Screen**

12. Allow at least one minute for temperature equilibration before proceeding. The current values of all enabled sensors will appear on the screen and will change with time as they stabilize.
13. Observe the reading under Specific Conductance. When the reading shows no significant change for approximately 30 seconds, press **Enter**. The screen will indicate that the calibration has been accepted and prompt pressing of **Enter** again to Continue.

**Calibrated**

14. Press **Enter** to return to the Conductivity Calibrate Selection Screen
15. Press **Escape** to return to the Calibrate menu. See Figure 6.2 Calibrate Screen.
16. Rinse the probe module and sensors in tap or purified water and dry.

### **Dissolved Oxygen Calibration**

This procedure calibrates dissolved oxygen. Calibrating any one option (% or mg/L) automatically calibrates the other.

1. Go to the calibrate screen as described in Section 6.2.1 *Accessing the Calibrate Screen*.

**NOTE:** The instrument must be on for at least 10 to 15 minutes to polarize the DO sensor before calibrating.

2. Use the arrow keys to highlight the **Dissolved Oxygen** selection. See Figure 6.2 Calibrate Screen.
3. Press **Enter**. The Dissolved Oxygen Calibration Screen is displayed.

Figure 6.7 DO Calibration Screen

### DO Calibration in Percent Saturation

1. Use the arrow keys to highlight the DO% selection.
2. Press **Enter**. The DO Barometric Pressure Entry Screen is displayed.

Figure 6.8 DO Barometric Pressure Entry Screen

3. Place approximately 3 mm ( $\frac{1}{8}$  inch) of water in the bottom of the transport/calibration cup.
4. Place the probe module into the transport/calibration cup.  
**NOTE:** Ensure that the DO and temperature sensors are **not** immersed in the water.
5. Engage only one or two threads of the transport/calibration cup to ensure that the DO sensor is vented to the atmosphere.
6. Use the keypad to enter the current local barometric pressure.

**NOTE:** If the unit has the optional barometer, no entry is required.

**NOTE:** Barometer readings that appear in meteorological reports are generally corrected to sea level and must be uncorrected before use

7. Press **Enter**. The DO% Saturation Calibration screen is displayed.

Figure 6.9 DO Sat Calibration Screen

8. Allow approximately ten minutes for the air in the transport/calibration cup to become water saturated and for the temperature to equilibrate before proceeding.
9. Observe the reading under DO %. When the reading shows no significant change for approximately 30 seconds, press **Enter**. The screen will indicate that the calibration has been accepted and prompt pressing of **Enter** again to Continue. See Figure 6.6 Calibrated.
10. Press **Enter** to return to the DO Calibration Screen, See Figure 6.7 DO Calibration Screen.
11. Press **Escape** to return to the calibrate menu. See Figure 6.2 Calibrate Screen.
12. Rinse the probe module and sensors in tap or purified water and dry.

## pH Calibration

1. Go to the Calibrate Screen as described in *Section 6.2.1 Accessing the Calibrate Screen*.
2. Use the arrow keys to highlight the **pH** selection. See Figure 6.2 Calibrate Screen.
3. Press **Enter**. The pH Calibration screen is displayed.

Figure 6.12 pH Calibration Screen

4. Select the **one-point** option only if adjusting a previous calibration. If a two-point or three-point calibration has been performed previously, the calibration can be adjusted by carrying out a one-point calibration. The procedure for this calibration is the same as for a two-point calibration, but the software will prompt a selection of only one pH buffer.
5. Select the **two-point** option to calibrate the pH sensor using only two calibration standards. Use this option if the media being monitored is known to be either basic or acidic. For example, if the pH of a pond is known to vary between 5.5 and seven, a two-point calibration with pH seven and pH four buffers is sufficient. A three-point calibration with an additional pH ten buffer will not increase the accuracy of this measurement because the pH is not within this higher range.
6. Select the **three-point** option to calibrate the pH sensor using three calibration solutions. In this procedure, the pH sensor is calibrated with a pH seven buffer and two additional buffers. The three-point calibration method assures maximum accuracy when the pH of the media to be monitored cannot be anticipated. The procedure for this calibration is the same as for a two-point calibration, but the software will prompt a selection of a third pH buffer.
7. Use the arrow keys to highlight the **two-point** selection.
8. Press **Enter**. The pH Entry Screen is displayed.

Figure 6.13 pH Entry Screen

9. Place the correct amount (see Table 6.1 Calibration Volumes) of pH buffer into a clean, dry, or prerinsed transport/calibration cup.

**NOTE:** Always calibrate with buffer seven first, regardless of whether performing a one-, two-, or three-point calibration.

**WARNING:** Calibration reagents may be hazardous to health. See reagent label for more information.

**NOTE:** For maximum accuracy, the pH buffers chosen should be within the same pH range as the water being prepared for sampling.

**NOTE:** Before proceeding, ensure that the sensor is as dry as possible. Ideally, rinse the pH sensor with a small amount of buffer that can be discarded. Be certain to avoid cross-contamination of buffers with other solutions.

10. Carefully immerse the sensor end of the probe module into the solution.
11. Gently rotate and/or move the probe module up and down to remove any bubbles from the pH sensor.  
  
**NOTE:** The sensor must be completely immersed. Using the recommended volumes from Table 6.1 Calibration Volumes should ensure that the sensor is covered.
12. Screw the transport/calibration cup onto the threaded end of the probe module and securely tighten.

**NOTE:** Do not overtighten because doing so could damage the threaded parts.

13. Use the keypad to enter the calibration value of the buffer being used **at the current temperature**.

**NOTE:** pH vs. temperature values are printed on the labels of all YSI pH buffers.

14. Press **Enter**. The pH Calibration Screen is displayed.

Figure 6.14 pH Calibration Screen

15. Allow at least one minute for temperature equilibration before proceeding. The current values of all enabled sensors will appear on the screen and will change with time as they stabilize.

16. Observe the reading under pH. When the reading shows no significant change for approximately 30 seconds, press **Enter**. The screen will indicate that the calibration has been accepted and prompt **Enter** to be pressed again to continue.
17. Press **Enter** to return to the specified pH Calibration Screen, See Figure 6.13 pH Entry Screen.
18. Rinse the probe module, transport/calibration cup, and sensors in tap or purified water and dry.
19. Repeat steps 6 through 13 using a second pH buffer.
20. Press **Enter** to return to the pH Calibration Screen. See Figure 6.12 pH Calibration Screen.
21. Press **Escape** to return to the Calibrate menu. See Figure 6.2 Calibrate Screen.
22. Rinse the probe module and sensors in tap or purified water and dry.

#### **Return to Factory Settings.**

1. Go to the Calibrate screen as described in Section 6.2.1 *Accessing the Calibrate Screen*.
2. Use the arrow keys to highlight the **Conductivity** selection. See Figure 6.2 Calibrate Screen.

**NOTE:** We will use the Conductivity sensor as an example; however, this process will work for any sensor.

3. Press **Enter**. The Conductivity Calibration Selection Screen is displayed. See Figure 6.3 Conductivity Calibration Selection Screen.
4. Use the arrow keys to highlight the **Specific Conductance** selection.
5. Press **Enter**. The Conductivity Calibration Entry Screen is displayed. See Figure 6.4 Conductivity Calibration Entry Screen.
6. Press and hold the **Enter** key down, and press the **Escape** key.

Figure 6.17 ORP Calibration Screen

7. Use the arrow keys to highlight the **YES** selection.

**CAUTION:** Pressing **YES** returns a sensor to the factory settings. For example, in the selection to return specific conductance to the factory setting, salinity and conductivity will automatically return to their factory settings.

8. Press **Enter** to return you to the Conductivity Calibrate Selection Screen. See Figure 6.3 Conductivity Calibration Selection Screen. .
9. Press **Escape** to return to the Calibrate menu. See Figure 6.2 Calibrate Screen.

## **HACH Digital Titrator (for Alkalinity) Primary Method**

Titration is performed using the HACH digital titrator. This instrument provides precise results when properly operated.

### **Basic Operation**

1. Select a sample volume and titration cartridge corresponding to the expected sample concentration.
2. Insert the cartridge into the titrator slide and lock it into place with the plunger. Remove the polyethylene cap from the cartridge and insert a clean delivery tube into the end of the cartridge. (Note: use a straight tube with a hook on the end for hand-held titrations and a 90° tube with a hook at the end for stationary setups.)
3. To start the titrant flow, hold the tip of the cartridge upward while turning the delivery knob until the air is expelled and several drops of solution flow from the tip of the delivery tube.
4. Use the counter reset knob (the smaller of the two knobs) to set the digital counter back to zero, then blot any titrant from the delivery tube.
5. Proceed with titration by submerging the tip of the delivery tube into the sample and turning the delivery knob to dispense the titrant. (Note: during the titration process, samples must be continuously stirred either manually or with the magnetic stirrer)

### **Calculations**

HACH titration cartridge solutions are designed to give those numbers used in the titrations (reading from the digital meter) to be actual sample concentration in mg/L, or they are marked with conversion factors. If in the process of sample preparation, the amount of SAMPLE becomes less than 100 mL, the titration number must be multiplied by the divisional factor. For example, if the intended 100-mL sample is reduced to 25 mL (¼ of 100 mL) during the sample-preparation process, then the final result must be multiplied by 4 (25 mL × 4 = 100 mL) to obtain the result.

### **General Maintenance**

1. For long-term storage the delivery tube should be removed, the polyethylene cap reattached, and the cartridge removed from the titrator body. DO NOT attempt to remove the cartridge from the titrator without recapping.
2. After use and removal from the cartridges, rinse the delivery tubes with deionized water to prevent clogging.

The titration process should be checked monthly by titration of a standard solution and recorded in the laboratory notebook. Acceptable results are obtained if the titration is within ±3% of the standard solution.

### **Alkalinity Determination Using the HACH Digital Titrator**

Alkalinity of water is defined by its acid-neutralizing capacity. Once a sample has been collected, geochemical changes can alter the sample's alkalinity. Therefore, alkalinity samples are to be analyzed in the field or immediately upon returning to the EAA laboratory.

#### **Procedure**

Sample alkalinity is determined by titration with sulfuric acid to a pH of 4.5 and includes all carbonate, bicarbonate, and hydroxide present within the sample. Values are recorded as mg/L calcium carbonate.

1. Follow the steps outlined in HACH digital titrator usage, with the sulfuric acid cartridge as the active titrant and the 90° delivery tube as a stationary setup.
2. Set up the HACH titrator unit and attach the digital titrator to the rotational holder and clamp securely.
3. The pH and temperature probes should also be connected to the titrastir at the end of the rotational holder. For best results, attempt to have the ends of the delivery tube, pH probe, and temperature probe at the same level.
4. Rinse a 25-mL pipette three times with deionized water and then three times with the sample water to be tested. Pipette 25 mL of this sample into a clean 50-mL beaker. Record this amount on the corresponding field sheet.
5. Place the beaker on the stir plate, put a stir bar in the beaker, and turn on the stirring function.
6. Rotate the titrastir arm toward the sample beaker, submerging the probes and delivery tube. Note: ensure that the titrator counter is reset to zero and the outside of the delivery tube is free of sulfuric acid before submerging.
7. Turn on the pH meter and record the stabilized pH reading of the sample. Record this value on the corresponding field data sheet.
8. Titrate by turning the delivery knob until the pH is reduced to 4.5, which is the endpoint, and the amount of titrant used should be recorded.
9. Calculate the alkalinity by multiplying the amount of titrant used by the dilution factor, and record on the appropriate field data sheet.

Collect a second alkalinity sample every ten samples as a field duplicate, and analyze as outlined above. The field duplicate percent difference should not exceed  $\pm 5\%$ , where %D is defined as

$$[(X1 - X2) / X1] \times 100 = \%D \text{ (X1 = original sample, X2 = duplicate sample)}$$

*(see next page for additional alkalinity procedures)*

## **Additional Procedures for Alkalinity Analyses, University of Minnesota Methodology (to be incorporated into the EAA methodology)**

### **Good Titration Practices**

#### Aliquot Measurement

- ◆ Sample aliquots should be measured with the most accurate method available.
- ◆ Rinse the volumetric flask with sample water.
- ◆ Never rinse the titration flask with sample water.
- ◆ Rinse the titration flask with De-Ionized water between samples and air dry (glass) or shake dry (PMP plastic).
- ◆ An electronic balance is preferred over a volumetric flask is preferred over a graduated cylinder.
- ◆ A 0.1g scale is comparable to a volumetric flask.
- ◆ An electronic balance allows the size of sample aliquots to be varied.
- ◆ An electronic balance allows aliquot size to be reduced in high alkalinity samples which reduces titration time.

#### Titration Equipment

- ◆ Digital titrator should be periodically lubricated.
- ◆ Titrant cartridges must be kept tightly capped to prevent evaporation.
- ◆ Old, partially used titrant cartridges should be replaced.
- ◆ Don't try to use every drop of acid in the titrant cartridge - when it gets low start a new cartridge.
- ◆ Delivery tubes should be flushed with fresh titrant before use and rinsed after use.
- ◆ A magnetic stirrer (battery powered for field use) helps ensure thorough mixing.

#### Titration Procedures

- ◆ All chemical analyses should be replicated.
- ◆ Titrations are done in triplicate to allow comparison of results ensuring that reproducible results are obtained.
- ◆ Replicates that vary by more than two percent indicate interference or analytic error.
- ◆ Real time analysis of the results allows additional titrations and/or a change in procedure to identify the sources of the interference or error.
- ◆ Work consistently and quickly to limit degassing and precipitation in your sample bottle.
- ◆ Add acid uniformly to each aliquot as if performing the first titration.

### **Colorimetric**

- ◆ Bromocresol Green / Methyl Red indicator dyes.
- ◆ pH 4.8 to 4.5 buffer solutions.
- ◆ Adding acid too quickly and incomplete equilibration will produce irregular results.
- ◆ Use buffered indicator solutions to define endpoint.
- ◆ Relies on human color interpretation.

### **Potentiometric**

#### pH Endpoint

- ◆ Meter calibration is critical.
- ◆ Adding acid too quickly and incomplete equilibration will produce irregular results.
- ◆ Must allow for solution equilibration and meter stabilization.
- ◆ Uses one data point to determine endpoint.

#### $\Delta$ pH/ $\Delta$ v acid

- ◆ Must be done in uniform steps through the endpoint.
- ◆ Adding acid too quickly and incomplete equilibration will produce irregular results.
- ◆ Organics may shift endpoint.
- ◆ Uses two data points to determine endpoint.

Figure 1 shows a typical “S” shaped titration curve. The inflection point represents the true alkalinity of the sample and may not occur at exactly pH 4.5.

### **Gran Titration**

- ◆ Uses many data points.
- ◆ Must be carried well past the endpoint.
- ◆ Requires graphical interpretation or linear regression.
- ◆ Adding acid too quickly and incomplete equilibration will produce non-linear trend.
- ◆ Presence of organics will produce non-linear trends.
- ◆ Least susceptible to operator error or chemical interference but should still be backed up by replicate measurements - replicate may be by colorimetric or potentiometric methods.

To calculate the alkalinity, use the formula  $(V_{\text{aliquot}} + V_{\text{titrant}}) \times 10^{(4.65 - \text{pH})}$  to plot an ascending line after the endpoint with apparent alkalinity on the x-axis;  $V_{\text{aliquot}}$  in ml,  $V_{\text{titrant}} = \text{titrator digits}/800$  and 4.65 is the assumed endpoint. A linear regression can then be used to calculate an x-intercept. Use only the points well after the endpoint to get the best regression as shown in Figure 2.

### **Common Interferences**

◆ **Highly colored waters**

Organic-rich waters with humic and fulvic acids.  
Often have low pH and correspondingly low alkalinity.

#### **Solutions**

Perform Gran Titration - by extrapolating from points below pH 4.5 a fairly precise determination of alkalinity can be made.

Add a second packet of indicator dye to intensify green and red colors.

◆ **Chlorinated waters**

Color change at endpoint goes from green to yellow.

Solution: Add 5 drops and 2N Sodium Thiosulfate to scavenge any free chlorine before titrating.

◆ **Clay-rich waters**

Colors of indicators are "off" often tending towards an orange endpoint.  
Commonly associated with poorly developed monitoring wells.

Solution: Filter the sample before titrating.

◆ **Muddy waters**

Suspended sediment may contain carbonates or clays that could react with the acid titrant.  
Thick sediment may mask the color changes.

Solution: Filter the sample, preferably after allowing sediment to settle.

## Use of the DR2800 Portable Spectrophotometer for Alkalinity Measurements (Secondary Method for Alkalinity Determination)

EAA currently uses the DR2800 Portable Spectrophotometer for measuring alkalinity values of samples in the event the Hach Digital Titrator is not available. Measurements are made at the EAA Camden building following the field sample-collection event. All measurements are to be recorded in the alkalinity notebook and on the field sheet. Operation procedures for this instrument are detailed next.

---

### Alkalinity, Total

DOC316.53.01257

---

#### Colorimetric Method

Method 10239

25 to 400 mg/L CaCO<sub>3</sub>

TNTplus™ 870

**Scope and Application:** For drinking water, wastewater and boiler water.

---

### Test preparation

#### Before the test:

**DR 2800 only:** Install the light shield in Cell Compartment #2 before performing this test.

Read the safety advice and expiration date on the package.

The recommended sample and reagent temperature is 15–25 °C (59–77 °F).

The recommended reagent storage temperature is 15–25 °C (59–77 °F).

TNTplus™ methods are activated from the Main Menu when the sample vial is inserted into the sample cell holder.

#### Collect the following items:

Description	Quantity
Total alkalinity TNT870 vials	variable
Light shield (DR 2800 only)	1
Pipette for 2.0-mL sample	1
Pipette for 0.5-mL sample	1
Pipette tips	variable

---

### TNTplus™ method

---

1. Pipette 2.0 mL of **Solution A** into test vial.

2. Pipette 0.5 mL of sample into vial.

3. Cap and invert vial until contents are well mixed.

4. Wait 5 minutes.

5. After timer expires, wipe vial and insert it into cell holder. Instrument reads barcode, selects method, and make measurement. No instrument zero required. Results are in mg/L CaCO<sub>3</sub>.

## Interferences

If samples contain particles, remove the particles by filtration through a 0.45- $\mu$ m filter.

## Sample collection, preservation, and storage

- Collect samples in clean plastic or glass bottles. Fill completely and cap tightly.
- Prevent excessive agitation or prolonged exposure to air. Complete the test procedure as soon as possible after collection for best accuracy.
- The sample can be stored for 24 h if cooled to 4 °C (39 °F) or below. Warm to room temperature before the test begins.

## Accuracy check

### Standard solution method required for accuracy check:

- Alkalinity Voluette® Ampule Standard Solution, 25,000 mg/L CaCO<sub>3</sub> (0.500 N)
- Ampule breaker
- Variable-volume pipette
- Pipette tips
- 100-mL volumetric flask, Class A
- Deionized water

1. Prepare a 250-mg/L CaCO<sub>3</sub> standard solution as follows:

- a.** Pipette 1.0 mL of alkalinity standard solution, 25,000 mg/L as  $\text{CaCO}_3$ , into a clean 1.0-mL volumetric flask.
  - b.** Dilute to the mark with deionized water. Mix well. Prepare this solution daily.
- 2.** Use this solution in place of the sample. Follow the TNTplus™ method test procedure. The result should be within 10% of the expected value.

## **Summary of method**

Carbonates and other buffers react with the reagent in the vial to change the pH. The pH affects the color of the indicator, which is measured photometrically at 615 nm.

## Calibration Procedures for Backup Instruments

The following pages contain a discussion of proper use of “backup” instrumentation owned by the EAA, but not in regular use. These instruments may be utilized during a contingency sampling event, or in the case where newer instrumentation is not available due to damage or other issues.

### Calibration Procedures for Luminescent Dissolved Oxygen Probe Model LDO10101 with HQ30d Meter

#### **Before calibration:**

The probe must have the correct service-life time stamp. Set the date and time in the meter before the probe is attached.

It is not necessary to recalibrate when moving a calibrated probe from one HQd meter to another if the additional meter is configured for the same calibration options.

To view the current calibration, push Select View Probe Data, then select View Current Calibration.

If any two probes are connected, push the **UP** or **DOWN** arrow to change to the single display mode in order to show the Calibrate option.

#### **Calibration notes:**

- % saturation or mg/L calibration methods are available in the Modify Current Settings menu.
- Slope value is the comparison between the latest calibration and the factory calibration shown as a percentage.
- Calibration is recorded in the probe and the data log. Calibration is also sent to a PC, printer, or flash memory stick if connected.

- Air bubbles under the sensor tip when submerged can cause slow response or error in measurement. If bubbles are present, gently shake the probe until bubbles are removed.

**Water-saturated air (100%) calibration procedure:**

1. Connect the probe to the meter. Ensure that the cable locking nut is securely connected to the meter. Turn on the meter.

2. Push **Calibrate**.

3. Push **Methods**. Select User Cal-100%. Push **OK**.

4. Rinse the probe cap with deionized water. Blot dry with a lint-free cloth.

5. Add approximately ¼ inch (6.4 mm) of reagent water to a narrow-neck bottle, such as a BOD bottle.

6. Put a stopper in the bottle and shake the bottle vigorously for approximately 30 seconds to saturate the entrapped air with water. Allow up to 30 minutes for contents to equilibrate to room temperature.

7. Remove the stopper. Carefully dry the probe cap using a nonabrasive cloth. Put the probe in the bottle.

8. Push **Read**. The display shows “Stabilizing” as the probe stabilizes. The display shows the standard value when the reading is stable.

9. Push **Done** to view the calibration summary.

10. Push **Store** to accept the calibration and return the measurement mode. If a rugged probe, install the shroud on the probe.

## Calibration Procedures for Conductivity Model 5197500 or 5197503 with sensION™ 5 (Backup Instrumentation)

### Before the test:

Collect samples in clean plastic or glass bottles.

Analyze samples as soon as possible after collection. However, samples may be stored at least 24 h by cooling to 4 °C (39 °F) or below (all storage temperatures have changed to 0 to 6 °C as per the EPA MUR, March 2007). When solutions are measured that are not at reference temperature, the meter automatically adjusts the conductivity value to reference temperature from 20 or 25 °C.

Water samples containing oils, grease, or fats will coat the electrode and affect the accuracy of the readings. If this coating occurs, clean the probe with a strong detergent solution, then thoroughly rinse with deionized water.

Mineral buildup on the probe can be removed with a diluted 1:1 hydrochloric acid solution. Refer to the meter user's manual.

Calibration instructions are given in the operation section of the meter manual. For most accurate results, calibrate before use or check the accuracy of the meter using a known conductivity standard.

### Calibrating with a Known Standard

1. Place the probe in a conductivity standard that is in the expected range of the samples. On the meter, choose one of four ranges that corresponds to the sample range. Agitate the probe to dislodge bubbles in the cell. Avoid resting the probe on the bottom or sides of the container.
2. Press **CAL**. Functional keys will appear in the lower-left part of the display. **CAL?** and **1.000 1/cm** will appear in the upper display. If the meter has been calibrated, the last calibration value will appear. The numeric keypad will become active.
3. Press the arrow keys to scroll to the factory-calibration options (1000 µS/cm or 18 mS/cm). To calibrate using one of

these standards, press **ENTER**.

4. If using a standard with a different value, use the number keys to enter the standard conductivity at 25 °C, then press **ENTER**. The meter will automatically correct the calibration measurement to 25 °C using the NaCl-based, non-linear temperature coefficient.

If the standard has a value of 25 °C in the  $\mu\text{S}/\text{cm}$  range, enter the value when 1000  $\mu\text{S}/\text{cm}$  is displayed. If the standard has a value of 25 °C in the  $\text{mS}/\text{cm}$  range, enter the value when 18  $\text{mS}/\text{cm}$  is displayed. All four places have a number entered in them. If a number entry error occurs, start over by pressing **SETUP/CE**.

5. When the reading is stable, the calibration is automatically stored, and the instrument returns to reading mode.

### Calibration Procedures for Turbidimeter

**Note:** *for best accuracy, use the same sample cell of four matched sample cells for all measurements during calibration. Always insert the cell so that the orientation mark placed on the cell during the matching procedure is correctly aligned.*

#### Calibration

1. Rinse a clean sample cell with dilution water several times. Then fill the cell to the line (~15 mL) with dilution water or use StablCal <0.1 NTU standard. *Note: the same dilution water used for preparing the standards must be used in this step.*
2. Insert the sample cell in the cell compartment by aligning the orientation mark on the cell with the mark on the front of the cell compartment. Close the lid, and press **I/O**. *Note: choose signal average mode option (on or off) before pressing CAL—the SIGNAL AVERAGE key in calibration mode.*
3. Press **CAL**. The CAL and S0 icons will be displayed and will flash. The four-digit display will show the value of the S0 standard for the previous calibration. If the blank value were forced to 0.0, the display would be blank (as shown.) Press **→** for a numerical display.

**Hach Company recommends the use of StableCal® Stabilized Formazin or formazin standards only for the calibration of Hach turbidimeters. Hach Company cannot guarantee the performance of the turbidimeter if calibrated with co-polymer styrene divinylbenzene beads of other suspension. DO NOT calibrate with Gelex® Secondary Standards.**

4. Press **READ**. The instrument will count from 60 to 0 (67 to 0 if signal average is on), read the blank, and use it to calculate a correction factor for the 20 NTU standard measurement. If the dilution water is less than or equal to 0.5 NTU, E 1 will appear when the calibration is calculated. The display will automatically increment to the next standard. Remove the sample cell from the cell compartment. *Note: turbidity of the dilution water can be “forced” to zero by pressing → rather than reading the dilution water. The display will show S0 NTU, and the up arrow key must be pressed to continue with the next standard.*
5. The display will show the S1 (with the 1 flashing) and 20 NTU, or the value of the S1 standard for the previous calibration. If the value is incorrect, edit the value by pressing the → key until the number that needs editing flashes. Use the up arrow key to scroll to the correct number. After editing, fill a clean sample cell to the line with well-mixed 20 NTU StablCal Standard of 20 NTU formazin standard. Insert the sample cell compartment by aligning the orientation mark on the cell with the mark on the front of the cell compartment. Close the lid.
6. Press **READ**. The instrument will count from 60 to 0 (67 to 0 if signal average is on), measure the turbidity, and store the value. The display will automatically increment to the next standard. Remove the sample cell from the cell compartment. *Note: for potable water applications with low turbidity values, instrument calibration may be stopped after the 20 NTU StablCal Standard has been read. Press CAL after reading the 20-NTU standard. Instrument calibration is now complete for the range of 0–20 NTU only. The instrument will continue to read turbidity values above 20 NTU. These values were not updated during the 0–20 NTU calibration.*
7. The display will show the S2 (with the 2 flashing) and 100 NTU of the value of the S2 standard for the previous calibration. If the value is incorrect, edit the value by pressing the → key until the number that needs editing flashes. Use the up arrow key to scroll to the correct number. After

editing, fill a clean sample cell to the line with well-mixed 100 NTU StableCal Standard or 100 NTU formazin standard. Insert the sample cell into the cell compartment by aligning the orientation mark on the cell with the mark on the front of the cell compartment. Close the lid.

8. Press **READ**. The instrument will count from 60 to 0 (67 to 0 if signal average is on), measure the turbidity and store the value. Then the display will automatically increment to the next standard. Remove the sample cell from the cell compartment.
9. The display will show the S3 (with 3 flashing) and 800 NTU, or the value of the S3 standard for the previous calibration. If the value is incorrect, edit the value by pressing the → key until the number that needs editing flashes. Use the up arrow key to scroll to the correct number. After editing, fill a clean sample cell to the line with well-mixed 800 NTU formazin standard. Insert the sample cell into the cell compartment by aligning the orientation mark on the cell with the mark on the front of the cell compartment. Close the lid.
10. Press **READ**. The instrument will count from 60 to 0 (67 to 0 if signal average is on), measure the turbidity, and store the value. Then the display will increment back to the S0 display. Remove the sample cell from the cell compartment.
11. Press **CAL** to accept the calibration. The instrument will return to measurement mode automatically. *Note: pressing CAL completes the calculation of the calibration coefficients. If calibration errors occurred during calibration, error messages will appear after CAL is pressed. If E1 or E2 appear, check the standard preparation and review the calibration; repeat the calibration if necessary. If CAL? appears, an error may have occurred during calibration. If CAL? is flashing, the instrument is using the default calibration.*

#### Notes

- If the **I/O** key is pressed during calibration, the new calibration data are lost, and the old calibration will be used for measurements. Once in calibration mode, only the **READ**, **I/O**, ↑, and → keys function. Signal averaging and range mode must be selected before the

calibration mode can be entered.

- If **E 1** or **E 2** is displayed, an error occurred during calibration. Check the standard preparation and review the calibration; repeat the calibration if necessary. Press **DIAG** to cancel the error message (**E 1** or **E 2**). To continue without repeating the calibration, press **I/O** twice to restore the previous calibration. If **CAL?** is displayed, an error may have occurred during calibration. The previous calibration may not be restored. Either recalibrate or use the calibration as is.
- To review a calibration, press **CAL** and then  $\uparrow$  to view the calibration standard values. As long as **READ** is never pressed and **CAL** is not flashing, the calibration will not be updated. Press **CAL** again to return to the measurement mode.

## pH Meter Calibration

The pH meter must be calibrated before daily use. The calibration may be accomplished in the laboratory or in the field. In addition to a “preuse” calibration, it is strongly recommended that the meter be checked with a standard buffer solution at least once during the day in order to observe any instrument drift that may have occurred.

### Manual Calibration (with two reference solutions)

1. Attach or verify that the pH-indicating electrode and the automatic temperature compensator (ATC) are on the display unit.
2. Remove the rubber filling solution plug (if so equipped) to allow equilibration of the internal solution to the ambient air. Allow approximately five minutes for the equilibration process, and replace the plug.
3. Turn on the unit and select the calibration mode.
4. Rinse both electrodes with deionized water and dry (carefully) any excess water.
5. Rinse the pH electrode in the first pH buffer (reference) solution. After rinsing, immerse the electrode in a container of the first reference solution, and stir to remove bubbles on the electrode.
6. Allow the display to read **READY** and begin flashing. If the pH reading is within the manufacturer’s specifications (see equipment manual), press **YES**. If not, press **NO** and repeat the procedure. The first standard will subsequently be locked into the unit’s memory.
7. To calibrate the meter to the second pH reference solution, repeat steps 4, 5, and 6 USING the second solution.
8. Remove and rinse probes IN deionized water, and begin sample analysis. Otherwise the meter may be turned off; it will keep calibrating as long as the power source remains intact.

### **Electrode Care and Maintenance for pH Meters**

The pH electrodes discussed above are of the temperature-compensating triode design. These probes are delicate and require careful handling. The probes should not be allowed to freeze and **MUST** be stored in a vial of the storage solution.

1. Inspect the probe for damage before each use. Verify that probes contain the appropriate levels of filling solution.
2. If filling-solution levels are low, more solution should be added. Use the Hach solution for Hach probes and the Orion solution for Orion probes.
3. If the probe appears sluggish when readings are taken, the filling solution should be drained and refilled with fresh solution.
4. During normal operations, the probe will become fouled with scale deposits and oils. Clean with laboratory-grade soap by soaking the probe in the soap solution and rinsing in deionized water. If fouling is not removed by this procedure, then a 0.1-N solution of HCL or HNO<sub>3</sub> can be used as a soaking media.
5. Probes must be stored in the electrode storage solution or in a 4.0-pH buffer solution. If probes are allowed to dry out, irreversible damage to the probe may occur.

### **Conductivity Probes**

Orion Conductivity/Temperature Meters, Models 122, 126, 128, and 1230

Conductance, refers to the ability of a substance to carry an electrical current. These probes are used to define the physical parameters of conductivity. Conductivity is the algebraic reciprocal of electrical resistance and is expressed in SI units of microSeimens per centimeter. Specific conductance is electrical conductance measured across a one-cm cube of liquid (sample) between opposing faces of two platinum electrodes at 25°C. Conductivity is the same parameter measured at ambient temperature that has not been temperature compensated to 25°C.

### **Calibration**

The conductivity meter must be calibrated in the laboratory or in the field daily. Conductance standards should be chosen to closely reflect the values expected in the sample groups. For example, if historical conductivity values for an area to be sampled range below 1000 µS/cm, the 500-µS/cm solution should be chosen. The meters are designed to provide a nonlinear-function temperature coefficient to correct calculations; however, best results may be obtained when samples are 25°C.

### **Calibration Steps**

- 1 Select conductivity measurement by turning the meter's conductivity/temperature selector knob from **OFF** to **CONDUCTIVITY** (labeled  $\Delta$ ).
- 2 Submerge the probe into THE selected conductivity standard (past the open area within the probe), and stir briefly to eliminate any air bubbles.
- 3 Maintain the probe in solution, wait for the reading to stabilize, and record the final value.
- 4 No manual adjustment for the meter exists; therefore, the process described herein provides a reference check. If the conductivity reading obtained from steps 1 through 3 is within  $\pm 3\%$  of the given standard value, the meter is deemed to be within tolerance limits. If repeated attempts fail to obtain readings within the acceptable range, the meter will require factory service.

### **Maintenance**

- 1 The meter electrode must be clean for readings to be accurate. Laboratory-grade soap may be used to clean dirt and oil deposits from the meter. For mineral deposits, a 1-M-HCl solution may be used in ten parts deionized water, and ten parts isopropyl alcohol as a soaking agent for their removal.
- 2 The conductivity probe may be stored dry. After each use, however, the probe should be rinsed in deionized water and blotted dry.
- 3 The unit will indicate a low battery by flashing **LOBAT** in the upper-left-hand corner of the LCD display. The nine-volt disposable battery should be changed out with the unit **OFF**, to prevent damage.

**APPENDIX E—Drinking-Water Standards and Chemical Health Effects,  
from 30 TAC 290, RG-346, and U.S. EPA, July 2002**

*(Note, regulatory limits change frequently for certain compounds, the data herein are for general comparisons. The reader should utilized the most recent data available online from TCEQ and EPA if sample results exceed regulatory limits)*

Parameter, Method, and Units	Maximum Contaminant Levels or Secondary Standards	Potential Health Effects from Ingestion of Water^	Sources of Contaminant in Drinking Water^
Temperature (°C) EPA 170.1	NE	NA	NA
pH measured at 25°C EPA 150.1	>7.0*	NA	NA
Turbidity (NTU)	NE	NA	NA
Dissolved oxygen (DO) (mg/L)	NE	NA	NA
Alkalinity total as CaCO <sub>3</sub> SM 2320 B (mg/L)	NE	NA	NA
Specific conductance µS/cm	NE	NA	NA
<b>Laboratory</b>		NA	NA
Alkalinity total as CaCO <sub>3</sub> SM 2320 B	NE	NA	NA
Bicarbonate (HCO <sub>3</sub> ) SM 2320 B	NE	NA	NA
Fecal coliform (CFU/100 mL)	0 MCLG <sup>1</sup>	NA	NA
Fecal strep (CFU/100 mL)	0 MCLG <sup>1</sup>	NA	NA
E. coli (CFU/100 mL)	0 MCLG <sup>1</sup>	NA	NA
pH measured at 25°C EPA 150.1	>7.0*	NA	NA
Specific conductance µS/cm	NE	NA	NA
<b>Nutrients (mg/L)</b>			
Nitrate-nitrite as N EPA354.1/300.0	10	Infants below the age of six months who drink water containing nitrate in excess of the MCL could become seriously ill and, if untreated, may die. Symptoms include shortness of breath and blue-baby syndrome.	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits

Parameter, Method, and Units	Maximum Contaminant Levels or Secondary Standards	Potential Health Effects from Ingestion of Water^	Sources of Contaminant in Drinking Water^
Nitrate as N E300	10	Infants below the age of six months who drink water containing nitrate in excess of the MCL could become seriously ill and, if untreated, may die. Symptoms include shortness of breath and blue-baby syndrome.	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Orthophosphate EPA 365.3	NE	NA	NA
Ammonia as N SM 4500	NE	NA	NA
Phosphorus	NE	NA	NA
<b>Major Ions (mg/L)</b>		NA	NA
Sulfate (SO <sub>4</sub> ) EPA 300.0	300*	NA	NA
Solids total dissolved (TDS) EPA 160.1	1,000*	NA	NA
Solids total suspended (TSS) EPA 160.2	NE	NA	NA
Bromide (Br) EPA 300.0	NE	NA	NA
Chloride (Cl) EPA 300.0	300*	NA	NA
Fluoride (F) EPA 340.2	2.0*	Bone disease (pain and tenderness of the bones); children may get mottled teeth	Water additive that promotes strong teeth, erosion of natural deposits, discharge from fertilizer and aluminum factories
<b>Metals by EPA 200.7 and 200.8 (µg/L)</b>		NA	NA
Aluminum	24,000**	NA	NA
		NA	NA
Antimony	6	Increase in blood cholesterol; decrease in blood sugar	Discharge from petroleum refineries, fire retardants, ceramics, electronics, solder
Arsenic	5	Skin damage or problems with circulatory systems and increased risk of cancer	Erosion of natural deposits; runoff from orchards and glass and electronics production wastes

<b>Parameter, Method, and Units</b>	<b>Maximum Contaminant Levels or Secondary Standards</b>	<b>Potential Health Effects from Ingestion of Water<sup>^</sup></b>	<b>Sources of Contaminant in Drinking Water<sup>^</sup></b>
Barium	2,000	Increase in blood pressure	Discharge of drilling wastes, discharge from metal refineries, erosion of natural deposits
Beryllium	4	Intestinal lesions	Discharge from metal refineries and coal-burning factories. erosion of natural deposits
Boron	4,900**		
Cadmium	5	Kidney damage	Corrosion of galvanized pipe, erosion of natural deposits, discharge from metal refineries, runoff from waste batteries and paints
Chromium	100	Allergic dermatitis	Discharge from steel and pulp mills, erosion of natural deposits
Cobalt	1,500**	NA	NA
Copper	1,300*	Short-term exposure, gastrointestinal distress; long-term exposure, liver or kidney damage. People with Wilson's disease should consult their personal doctor if the amount of copper in their water exceeds the action level.	Corrosion of household plumbing systems, erosion of natural deposits
Iron	300*	NA	NA
Lead	15	Infants and children: delays in physical or mental development; children could show slight deficits in attention span and learning abilities. Adults: Kidney problems, high blood pressure	Corrosion of household plumbing systems, erosion of natural deposits
Lithium	490**	NA	NA
Manganese	1,100*	NA	NA
Molybdenum	120**	NA	NA
Nickel	490**	NA	NA

Parameter, Method, and Units	Maximum Contaminant Levels or Secondary Standards	Potential Health Effects from Ingestion of Water^	Sources of Contaminant in Drinking Water^
Selenium	50	Hair or fingernail loss, numbness in fingers or toes, circulatory problems	Discharge from petroleum refineries, erosion of natural deposits, discharge from mines
Silver	120*	NA	NA
Strontium	15,000**	NA	NA
Thallium	2	Hair loss; changes in blood; kidney, intestine, or liver problems	Leaching from ore processing sites; discharge from electronics, glass, and drug factories
Uranium	30	NA	NA
Vanadium	1.7**	NA	NA
Zinc	7,300*	NA	NA
		NA	NA
<b>Metals by E200.8 (mg/L)</b>			
Calcium	NE	NA	NA
Magnesium	NE	NA	NA

Turbidity	NA	NA	NA
	NA	Turbidity is a measure of the cloudiness of water. It is used to indicate water quality and filtration effectiveness (e.g., whether disease-causing organisms are present). Higher turbidity levels are often associated with higher levels of disease-causing microorganisms such as viruses, parasites, and some bacteria. These organisms can cause symptoms such as nausea, cramps, diarrhea, and associated headaches.	Soil runoff

Maximum contaminant level and secondary standards from 30 TAC 290 Subchapter F.

\*\* Numerical value for risk reduction not an MCL, but provides a measure of desirable concentrations, from RG-346 ([www.sos.state.tx.us](http://www.sos.state.tx.us)).

**APPENDIX F—Stormwater-Sampling Detail**

## **Stormwater-Sampling Program for Comal and San Marcos Springs in Support of the Edwards Aquifer Habitat Conservation Plan**

### **PURPOSE**

The purpose of this technical procedure is to describe the methodology for collecting grab samples from stormwater runoff in surface waters at Comal and San Marcos springs. Sample frequency is twice annually, with samples collected across three points on the hydrograph. The EAA samples storm waters at Comal Springs at the following five locations (see Appendix A for map):

1. Upper Springs (near Blieders Creek),
2. New Channel—(below confluence with Dry Comal Creek),
3. Upper Old Channel—(at Elizabeth Street),
4. Lower Old Channel—(above Hinman Island), and
5. Comal River—(above confluence with Guadalupe River).

The EAA samples stormwaters at San Marcos Springs at the following seven locations (see Appendix A for map):

1. Sink Creek, upstream of Spring Lake,
2. Sessoms Creek,
3. Dog Beach Outflow,
4. Hopkins Street Outflow,
5. Purgatory Creek (above San Marcos River),
6. I-35 Reach, and
7. Willow Creek (above San Marcos River).

### **SCOPE**

This procedure applies to all EAA personnel and subcontractors who sample storm water.

### **DEFINITIONS**

1. Stormwater runoff as stated by the US EPA, “is generated when precipitation from rain and snowmelt events flows over land or impervious surfaces and does not percolate into the ground” (US EPA Stormwater Program, [epa.gov](http://epa.gov)).
2. Rivers are sources of water that flow on top of the ground in volume.
3. Sample intervals (for the EAHCP stormwater sampling program) are defined as:
  - a. Initial rise, or rising limb of the hydrograph;
  - b. Peak area of hydrograph; and
  - c. Recession limb of the hydrograph.

## **GENERAL**

Weather permitting, EAA will sample two stormwater events per year to evaluate stormwater quality from urban landscapes that discharge to Comal and San Marcos springs.

## **STORM-EVENT SELECTION CRITERIA**

According to the *Water Quality Monitoring Program Strategy for Comal Springs and San Marcos Springs in Support of the Edwards Aquifer Habitat Conservation Plan*, (EAHCP Workplan “a storm water sampling event will be triggered when a local rainfall event causes a significant increase in spring flow at the historic Comal Springs gauging station and the San Marcos Springs gauging station.” Furthermore, data collected from real-time instrumentation for surface water quality will be used to further refine the type of stormwater event(s) to be sampled. Real-time data are collected for the following parameters at 15-minute intervals from the stations shown on Comal and San Marcos springs EAHCP maps (Appendix A):

- Conductivity,
- DO,
- pH,
- Temperature, and
- Turbidity.

EAA field staff will monitor incoming storms by radar to determine whether the storm will produce one-half inch or more of localized precipitation and determine whether the storm is safe for stormwater sampling. Because of the nature of storms, stormwater sampling may be canceled as a result of false starts, safety issues, or if a new storm interrupts the stormwater sampling. Aquifer Science Management will make the final determination regarding go/no go for stormwater sampling.

## **Minimum Antecedent Dry Period Requirements**

The following is a guideline to determine whether watersheds have returned to “normal” flow conditions. Each watershed will be evaluated separately because one watershed may return to “normal” flow conditions faster and technically be ready for another stormwater sampling event before another watershed, as noted below:

- One day wait if the previous rain event was limited to light rain/drizzle, producing only a surface wetting and no runoff
- Three days wait if the previous rain event did not produce enough rainfall to result in a measurable increase in discharge at the sample location(s)

- Minimum of five days wait if preceded by a rainfall of at least one-half inch at a sample location. The antecedent dry period may be longer if the sample location(s) are still being impacted by runoff from a previous rain event (SARA, 2013).

### **Canceling a Stormwater-Sampling Event**

- A stormwater-sampling event may be canceled because of excessive lightning, hail, high winds, or flooding. If a storm does become severe during a stormwater-sampling event, the event will be postponed, cancelled, or suspended under some circumstances.
- A stormwater sampling event may be suspended because of a new rain event. For example, if samples are collected during the 10% of baseline flow conditions and another storm event interrupts this sampling event, then sampling will be suspended. The second storm will represent a new stormwater event.

## **RESPONSIBILITIES**

### **CTO and Hydrogeologist Supervisor—Aquifer Science**

The CTO and hydrogeologist supervisor—aquifer science will determine which parameters need to be sampled and will ensure that the samples obtained represent the environment being investigated. Sampling parameters are listed in the EAHCP workplan.

### **Hydrologic Data Coordinator**

The hydrologic data coordinator will schedule sampling events and ensure that all field crews are provided with the information and equipment necessary to successfully complete scheduled sampling (i.e., location ID and selected analyses). Furthermore, the coordinator will organize and interface with local entities as needed to ensure that all notifications are in place for each river/spring complex as needed.

### **Environmental Science Technicians**

Environmental science technicians will generally be responsible for collection of samples. Other individuals may also be asked to participate in sample-collection activities. However, each sample team of two people will have a lead sampler who reports back to the hydrogeologist supervisor—aquifer science. Reports will include

problems and issues in the field, inability to sample because of unforeseen or changing circumstances, and any deviations from the sample-collection plan and protocols.

## **PROCEDURE**

### **Supplies and Equipment**

#### **Major Equipment Items**

- Sample dipper
- Peristaltic pump with inert sample tubing
- 500- or 1,000-mL Teflon™ beakers affixed to telescoping rods
- Two gallon buckets for field-parameter readings

#### **Equipment Support Items**

- Trash bags
- Gloves (nitrile)
- Kim wipes/towels
- Rope
- Garden wagon

#### **Sampling Supplies**

- Sample bottles
- COC forms
- Sample labels
- Bailer (for filtration)
- 0.45-micron filter
- Ice chest
- Ice for sample preservation
- Ziplock bags
- Field sheet
- Pen and waterproof permanent marker

#### **Monitoring Equipment**

- pH and temperature meter
- Specific conductance meter
- Dissolved-oxygen meter
- Turbidity meter

### **Health and Safety Items**

- First-aid kit and emergency eye-wash kit
- Fire extinguisher
- Mobile phone
- Helmet with head lamp
- Hand sanitizer
- Mud boots
- Raincoat
- Life vests with reflective markings
- Throw rope
- Computer access to real-time flow, water quality, and weather data

### **Field Equipment Decontamination**

Proper decontamination between sites is essential to the avoidance of introducing contaminants from the sampling equipment. Before sampling, all hoses, buckets, water quality probes, and other sampling equipment should be decontaminated at EAA before fieldwork. Procedures specified in the EAA's *Field Sampling Plan* should be followed for decontamination of field equipment.

### **Instrument Usage and Measurement of Water Quality Parameters**

Before going into the field, the environmental science technician should verify that all field instruments are operating properly. Calibration will be done on pH, specific conductivity, dissolved oxygen, and turbidity meters, and calibration information should be recorded in the calibration log book.

### **Purging**

No purging is required for stormwater runoff to be sampled in the Comal and San Marcos rivers.

### **Sample Collection**

According to the EAHCP work plan, “three water quality samples will be collected from each surface water sampling location during the sampling event. Sample times will be spaced to reflect changes in the stream hydrograph.” The first sample will be during the initial rise in the hydrograph. The second sample will be collected near the peak of flow. The final sample will be collected along the recession limb of the storm hydrograph. In some circumstances, additional samples may be collected during the storm event such

that sample groups may be subsequently compared to hydrograph data and the most representative samples groups sent for analyses. Following is the sampling procedure:

#### **At EAA Offices**

- EAA field staff will monitor local weather forecasts and Doppler radars to determine whether an incoming storm meets the criteria for a stormwater sampling event.
- If the incoming storm DOES NOT meet the criteria, no action will be taken.
- If the incoming storm DOES meet the criteria, EAA field staff will monitor weather conditions, estimate a time of arrival of the incoming storm, and determine whether weather conditions are safe for stormwater sampling (CTO or hydrogeologist supervisor will make the final go/no go decision).
- EAA field staff will notify the contracted laboratories for the possibility of samples.
- Labels for the sample bottles will be filled out.
- Aquifer Science CTO or Hydrogeologist supervisor will make the final determination regarding go/no-go with regard to the storm event.

#### **In the Field**

- Field personnel must wear clean (disposable) nitrile gloves during the sample-collection process.
- Sample water will be collected in a two-gallon bucket for parameter readings, and sample water will be collected in a 500- or 1000-mL Teflon™ beaker attached to telescoping rods, or, if needed, a peristaltic pump with inert tubing will be used.
- Meter(s) will be inserted into a two-gallon bucket and measurements recorded on a field sheet, or, if a peristaltic pump is being used, a flow chamber will be used.
- Samples will be collected using beakers or a peristaltic pump.
  - Herbicides and pesticides
  - General water quality parameters
  - Selected metals
  - Turbidity
  - Bacteria (E-coli most probable number)
  - Total phosphorous
  - Total organic carbon
  - Dissolved organic carbon
  - Total kjeldahl nitrogen
  - All containers will be filled almost full, except for alkalinity and VOCs
  - Alkalinity

- A bailer attached with a filter will be used or a filter will be attached onto tubing from the peristaltic pump
  - Alkalinity must have no head space.
- Selected metals
  - A bailer attached with a filter will be used or a filter will be attached onto tubing from the peristaltic pump
- VOC
  - The VOC sample vial will be completely filled so that the water forms a convex meniscus at the top and then capped so that no air space exists in the vial. The vial must be turned over and tapped to check for bubbles in the vial, which indicate trapped air. If bubbles are observed, the vial should be discarded and another sample collected.
- Any required information will be recorded on the field sheet before, during, and after sampling. Parameter readings will be measured in a two-gallon bucket and recorded on field sheets.
- Preservatives (if any) will be placed in the bottles by EAA-contracted laboratories.
- After the samples have been collected, they will be immediately placed in an ice-filled cooler.
- Prior to departure from the field, field documentation, including the COC form, will be completed, and all EAA field employees will clean their hands with hand sanitizer.
- Field notebooks will be used to record basic information for each event, such as magnitude of storm, issues related to sample collection, weather conditions, time of day samples were collected, and other information deemed pertinent by the lead sampler and/or coordinator.

The second sample will be collected near the peak of flow and will follow the same procedure as that of the initial rise on the hydrograph sample. The third sample will be collected along the recession limb of the hydrograph and will follow the same procedure as that of the other two sampling events. Again, the possibility exists that additional sample may be collected during the event with the most representative three sample groups being submitted for analyses (based on comparison with the appropriate stream hydrograph).

### **Contracted Laboratories**

EAA field staff will drop off samples at EAA-contracted laboratories or have samples picked up at the EAA offices. Samples will be analyzed within proper holding times.

## **Equipment Blanks**

Equipment blanks consist of ASTM II, reagent-grade water poured over/through any sampling equipment used for collection of definitive samples. Most sample-collection equipment is disposable; however, in some cases, an equipment blank may be required. Equipment blanks are used to assess the effectiveness of decontamination procedures (for new materials provided to the EAA or from EAA's decontamination processes) and are designated as *EB* on the COC. The frequency of collection of equipment blanks will depend on the sampling routine and sampling equipment in use. Collection of equipment blanks will be designated prior to sample-collection events.

## **Trip Blanks**

Trip blanks are used to assess potential volatile organic contamination during sample custody in the field and shipment to the receiving laboratory. Trip blanks are submitted with characteristic samples to the laboratory to verify that volatile organic contamination has not occurred from outside influences during sample handling to transport (such as absorption through the septa.)

Trip blanks consist of two 40-mL vials filled with ASTM Type II reagent-grade water prepared by the contracted laboratory. Trip blanks will remain unopened until they are received at the contracted laboratory.

## **Sample Identification, Handling, and Documentation**

Samples will be identified, handled, and recorded as described in the preceding sections of this document.

## **Records**

Field sheets and COCs will be kept in a bound field log book. The following will be recorded using waterproof ink on these sheets and in the field notebook:

- Names of sampling personnel
- Weather conditions
- Project name
- Date and time of sampling
- Analyses to be performed by EAA-contracted laboratory
- Equipment-calibration information
- Field-parameter measurements
- Irregularities, problems, or delays

## **APPENDIX G—Equipment-Decontamination Procedures**

## **Decontamination**

Proper decontamination of all equipment used in the sample-collection process is essential to obtaining quality, representative samples. Improperly decontaminated equipment is capable of causing cross-contamination between sample sites, resulting in samples that are not representative of in situ site conditions. The objective of this appendix is to provide a set of decontamination procedures applicable to various EAA equipment and sampling programs.

Whereas many different protocols exist for decontamination, ASTM Standard D 5088 is perhaps the most commonly referenced protocol. The methods outlined here are tailored to EAA sampling environments and programs.

## **Basic Decontamination Procedure—Groundwater, Surface Water, and Spring Sampling Equipment**

When possible, equipment that comes into contact with sample media will be single-use (disposable) equipment or dedicated equipment. Having such equipment helps reduce the possibility of cross-contamination of samples. However, for many sample types, such dedicated equipment may not be possible. As such, a listing of equipment that may be used to collect a water sample (groundwater, surface water, or spring) would include

- Grundfos submersible pump and associated pump tubing
- Peristaltic pump tubing
- Sample dippers
- Surface water churn

Other equipment that *may* come into direct contact with sample media of concern includes

- Water level measurement devices (steel tape and e-lines)
- Field-parameter probes
- Downhole geophysical equipment

Equipment that will have direct contact with any sample media will be decontaminated prior to use for sample collection or prior to introduction into the well, surface water site, or spring vent, as applicable.

## **Grundfos Submersible Pumps**

Decontamination will be accomplished as follows for submersible well pumps. Sampler will wear new, disposable, nitrile (or equivalent) gloves to perform the decontamination.

Materials needed:

- Submersible pump, pump controller, and pump tubing
- 33-gallon trashcan (dedicated for decon use only)
- Alconox® or laboratory-grade soap
- DI water
- Large plastic bags or foil
- Plastic sheeting
- Clean scrub brush(es)

The designated trashcan will be rinsed with fresh, potable water and subsequently filled with potable water and laboratory-grade soap (per soap label directions).

When the container is approximately 80% full, the pump will be lowered, with heat shield attached, into the trashcan. The pump should be suspended at least six inches off the bottom of the trashcan. The pump will then be activated and allowed to discharge outside of the trashcan for at least 30 seconds. After the initial discharge, pump tubing will be directed into the trashcan such that the decontamination mixture is recirculated through the pump and tubing. The pump should run/recirculate a minimum of ten pump-tubing volumes (about 40 gallons) through the system. This process should take about 15 to 20 minutes.

Note: in the event that the pump or tubing has sediment or other foreign matter on it, a step will be added. A clean scrub brush will be used to remove any sediment or other foreign matter from the equipment manually prior to the circulation process.

Next, the decontamination mixture will be allowed to pump out of the trashcan into the sink (the pump should not be allowed to run dry or cavitate). The pump and tubing will be placed on a clean surface (plastic sheet) and the trashcan rinsed in clean water. The pump will be rinsed and placed back into the trashcan. The pump is to be allowed to discharge outside of the trashcan until the soapy water is evacuated from the tubing. The discharge tubing will then be placed back into the trashcan and more clean water added if needed. The freshwater will be recirculated through the pump and into the trashcan for a minimum of ten volumes (about 40 gallons). Once circulation is complete, the pump will be allowed to discharge outside the trashcan until nearly empty (again, the pump should not be allowed to run dry or cavitate). Next, a final rinse of DI water will be provided on the pump and tubing, an adequate volume being used to ensure that the pump and tubing are well rinsed.

Upon completion of the decontamination procedure, the pump will be sealed in a clean plastic bag, and the end of the pump tubing will be sealed in its own clean plastic bag. A

rubber band can be used to affix the bags around the apparatus. Pump and hose assembly are to be stored indoors when not in use, away from any sources of cross-contamination.

### **Tubing Decontamination for Peristaltic Pumps:**

Decontamination should be accomplished as follows for peristaltic pump tubing. Sampler will wear new, disposable, nitrile (or equivalent) gloves to perform the decontamination.

Materials needed:

- Four five- or seven-gallon plastic buckets (for decon use only)
- Alconox® or laboratory-grade soap
- DI water
- Large plastic bags that can be sealed (large zip-top bags)
- Plastic sheeting
- Clean scrub brush(s)

The designated buckets will be rinsed in fresh, potable water. The first bucket will be subsequently filled with potable water and laboratory-grade soap (per soap label directions). The next two buckets will be filled with clean tap water. All three decontamination buckets are to be placed on top of a clean sheet of plastic sufficiently long to provide a clean surface on which all decontamination can take place. Decon buckets are to be placed in order on the sheet, with the soap bucket first, followed by the two rinse buckets. Decontamination should proceed such that each step is always followed in order from most contaminated to least contaminated (i.e., from prewash if needed, to soap–water mixture, to first rinse bucket, to second rinse bucket, to final DI water rinse).

Any excess foreign material will be removed from the tubing, first by wiping or scrubbing with soap and water mixture (if needed). The suction side of the tubing will be lowered into the soap–water bucket. The pump will be activated and allowed to discharge outside of the bucket until the soap–water mixture has initially purged the tubing. After the initial discharge, the pump tubing will be directed into the bucket such that the decontamination mixture is recirculated through the tubing. The pump will be allowed to run a minimum of ten pump-tubing volumes through the system (or about eight to ten gallons).

Next, the suction end of the tubing will be placed into the first rinse bucket and the pump allowed to discharge into the soap bucket until the soapy water is evacuated from the tubing. The discharge side of the tubing will then be placed back into the first rinse bucket. The freshwater will be allowed to recirculate through the pump and into the first rinse bucket for a minimum of ten volumes (or about eight to ten gallons). Once circulation is complete, the process will be repeated using the second rinse bucket. Final rinse is to be accomplished by pumping/recirculating DI water through the tubing for a minimum of ten volumes, using the third rinse bucket filled with DI water. Next, a final

rinse of DI water will be provided on the outside of the tubing using an adequate volume to ensure that the tubing is well rinsed. This final rinse will complete the decontamination process.

Upon completion of the decontamination procedure, the tubing will be allowed to dry and the tubing seal placed in a plastic bag to prevent exposure to cross-contamination. Bagged tubing is to be stored indoors when not in use away from any sources of cross-contamination.

Note: peristaltic tubing for EAHCP samples is dedicated tubing and is to be stored in *labeled* bags. The bag label will have the name of the sample point written on the outside of it. EAHCP-related tubing is not to be used for any other applications.

### **Decontamination of Other Equipment Used in Collection of Water or Soil Samples**

Decontamination will be accomplished as follows for other equipment that will come into direct contact with sample media (dippers, churns, sample probes—if placed into sample media, water level measurement devices, soil sampling devices, or trowels). Sampler will wear new, disposable, nitrile (or equivalent) gloves to perform the decontamination.

Materials needed:

- Sample-collection device (dipper, churn, etc.) or field meter (applies only to that part of the probe exposed to sample media) or water level measurement device
- Three five- or seven-gallon plastic buckets (for decon use only)
- Alconox® or laboratory-grade soap
- DI water
- Large plastic bags or foil
- Plastic sheeting
- Clean scrub brush

Designated buckets will be rinsed in fresh, potable water. The first bucket will be subsequently filled with potable water and laboratory-grade soap (per soap label directions). The remaining two buckets will be filled with clean tap water. All three decontamination buckets are to be placed on top of a clean sheet of plastic sufficiently long to provide a clean surface on which all decontamination will take place. Decon buckets are to be placed in order on the sheet, with the soap bucket first, followed by the two rinse buckets. Decontamination will proceed such that each step is always followed in order from most contaminated to least contaminated (i.e., from prewash if needed, to soap–water mixture, to first rinse bucket, to second rinse bucket, to final DI water rinse).

Any excess sediment or foreign matter will be removed from the device by gentle scrubbing and rinsing with water prior to placement into the soap–water mixture. The

sampling device will be placed into the soap–water mixture and gently scrubbed (all surfaces that will come into contact with sample media must be cleaned).

Note: the surface water churn may not fit in the bucket(s), as such the churn may be cleaned in the 33-gallon trashcan, or it may be cleaned by some of the soap–water mixture being poured into the churn. The churn will be cleaned with the soap–water mixture; double rinsed in clean, potable water; and provided a final rinse in DI water.

Upon completion of the soap–water wash, each device being decontaminated must be double rinsed (i.e., buckets two and three) in clean, potable water, followed by a final rinse in DI water. Upon completion of decontamination, equipment will be allowed to dry and stored such that it is not exposed to potential contaminants. Equipment should be stored in plastic bags or wrapped in foil to further insulate it from potential contamination.

Note: decontamination buckets are to be monitored when used for multiple items to ensure that the soap–water mixture does not become spent or ineffective. They are to be replaced as needed. Also, rinse water should be replaced regularly when it appears to have a significant accumulation of soap.

### **Special Decontamination Procedures**

Downhole or soil-sampling equipment may be decontaminated generally by one of the applicable processes outlined above. However, in rare cases, a tool or device that is not disposable may be exposed to hydrocarbon residue or, in rarer cases, high concentrations of heavy metals may occur. In such a scenario, the tool may (at the discretion of management) require a more elaborate decontamination procedure.

### **Exposure to Hydrocarbons**

In the event that a tool is exposed to free-product hydrocarbons, an additional step in the decontamination process may be required that will involve spraying the tool with pesticide-grade methanol or hexane prior to the final DI water rinse. Use of solvents in this case serves to remove any hydrocarbon residual from the tool.

### **Exposure to Heavy Metals**

In the event that a tool or device is exposed to heavy metals, and the sample media are being analyzed for these same metals, another step in the decontamination process may be required. In this case, the tool may require a spray rinse with dilute (10%) hydrochloric or nitric acid prior to DI water rinse. Use of acid in this situation will act to remove residual metals from the tool.

Note: use of solvents or acids is only to be pursued if directed by management. Use of these products can be hazardous and can also present issues regarding disposal of the waste products themselves. Use of the products may also damage sampling equipment in

some cases. In the vast majority of cases, the standard washing and rinsing procedures described herein are adequate for proper decontamination of sampling equipment. Analysis of equipment blanks will be pursued when needed so that the decontamination process might be assessed. It is the responsibility of the sampler to notify management if a tool is suspected of any unusual exposure

**APPENDIX F**

**RECORD OF STORMWATER SAMPLING**

---

*This page intentionally left blank.*

January 4, 2016 – SWCA staff began restocking and assembling necessary supplies and equipment.

January 2016 (and prior to each subsequent event) – Sample kits, labels and Chain-of-Custody (COC) forms were received from a contract laboratory and sampling containers, and coolers were labeled by SWCA staff.

January 11, 2016 – Staff went on standby for sampling events when all preparations were complete.

April, 2016 –The overall goal of the program is to sample each system at the beginning and end of the year. After completion of one event in each spring system EAA requested SWCA hold stormwater sampling until after July 1, 2016.

July 1, 2016 – SWCA sampling teams returned to on-call status and began monitoring forecasts for stormwater sampling.

## **COMAL SPRINGS COMPLEX**

April 12-13, 2016 – SWCA staff mobilized to New Braunfels in the evening of April 12, 2016. A base camp was established at the Schlitterbahn Resort. Rain began to fall and lead sampling was initiated at approximately 23:00 on April 12, 2016. Peak sampling was initiated at approximately 01:45 on April 13, 2016. Specific conductivity recovered quickly but then began to fall again and peaked at a slightly lower level than the 01:45 peak. SWCA collected a second set of peak samples at approximately 04:30. EAA was consulted and it was determined that the 01:45 peak would be submitted for analysis and the 04:30 peak would be discarded. Trail sampling was initiated at approximately 08:00, after specific conductivity had recovered to within 50% of the base flow condition. Samples were filtered using a peristaltic pump at the Schlitterbahn Resort. At the conclusion of the event, samples were transported back to SWCA's San Antonio office where they were retrieved by a contract laboratory. *E. coli* samples were hand delivered by SWCA staff to another contract laboratory on the morning of April 13, 2016.

September 24-27, 2016 - SWCA monitored weather forecasts and radar on September 24 and 25, 2016. The forecasts had showed opportunities for rain on the 24th, but those chances diminished. By 21:00 on the 24th, chances for rain on the 25th were much less than 50% chance of less than 0.5 inch for New Braunfels. The chance of rain in San Marcos for the 25th was 50% chance of 0.6 inch at 13:00. However, when the forecast was checked at 07:30 on the 25th the chance of rain for San Marcos did not exceed 50% until midnight. The chance of rain in New Braunfels was not predicted to reach 50%.

SWCA project manager, Philip Pearce, P.G., checked the forecast again at noon and at 14:00. At those times the chance of rain in New Braunfels was never predicted to be near 50%. The chance of rain was very low until midnight in San Marcos. Between 14:15 and 14:30, SWCA storm team member, Jennifer Moreland observed the forecasts for both cities change drastically, rain cells had developed and headed toward San Marcos. SWCA staff was not able to get to the office, load equipment, and drive to San Marcos in time to capture the first flush of the storm event. However, over 1 inch of rain was predicted to fall in New Braunfels later in the evening, and only scattered showers had fallen in New Braunfels thus far. After

talking with Gizelle Luevano at the EAA, it was determined that it would be appropriate to sample the Comal River system if sufficient rainfall occurred later that afternoon or evening. SWCA sampling teams arrived in New Braunfels around 17:30 and continued to monitor the weather forecasts and radar. Light showers began to fall around 19:00. Radar showed more intense rainfall to the south of New Braunfels, but the rainfall did not intensify enough in New Braunfels to affect water quality measurably in the Comal River. The rainfall south of New Braunfels was a very large cell that covered much of South Texas. SWCA therefore, continued to watch the radar to see if it would expand and intensify in the New Braunfels area.

The weather forecast indicated a small chance of thunderstorms at 5:30 am, Monday morning. At about 02:00 SWCA set alarms for 04:00 and 05:00 am to check on conditions, and turned out the lights. More intense rain began to fall almost immediately and by 02:45 the specific conductivity began to drop. Lead sampling was initiated at this time. By 05:00, the specific conductivity rose suggesting the storm was peaking, so a set of peak samples (Peak 1) were collected. After returning to base camp the specific conductivity began dropping again. Later, at approximately 07:15 the specific conductivity began to rise suggesting the storm was peaking. Therefore, we collected another set of samples (Peak 2). Specific conductivity dropped and rose two more times, but rain cells were visible on radar approaching New Braunfels from the southeast. Therefore, additional drops in specific conductivity were anticipated, and samples were not collected at those times. By 11:00, the conductivity rose slightly and no significant rainfall was approaching New Braunfels on weather radar. SWCA sampling teams deployed teams to sample locations. However, before samples were collected the conductivity began to drop again, although no rainfall was present and no significant runoff entering the Comal River was visible by sample teams.

At sample location HCS250 (Lower Old Channel) the sample team observed the Comal River level was out of the banks. At 12:15 some flow was observed in the middle of the channel. Over a period of approximately 45 minutes, the water level continued to rise. Flow in the center of the channel ceased and flow was observed moving in the upstream direction. It was apparent flood water from the Guadalupe River was moving up the Comal River. The specific conductivity as measured in the Comal Springs Old Channel continued to drop. Phil Pearce, contacted EAA staff member, Gizelle Luevano and described the situation. EAA indicated that SWCA should submit and analyze the second set of peak samples collected by SWCA at 07:15, and that no other samples should be collected to evaluate a peak due to influence by water from the Guadalupe River. SWCA finished running alkalinity tests on the samples that had already been collected and returned to the SWCA San Antonio office.

Lead, Peak 1 and Peak 2 samples were picked up by a contract laboratory the same day. Lead and Peak 1 *E. coli* samples were delivered to another contract laboratory by an SWCA runner on the morning of September 26, 2016. Peak 2 *E. coli* samples were delivered to a contract laboratory by SWCA sampling team members when sampling concluded on September 26, 2016.

SWCA deployed a team the following day, September 27, 2016, to collect the trail set of samples during the falling limb of the hydrograph. Trail samples were submitted to the contract laboratories on September 27, 2016.

## SAN MARCOS SPRINGS COMPLEX

March 9, 2016 – SWCA sampling teams deployed to the San Marcos Nature Center in the evening on March 8, 2016. Lead sampling was initiated at approximately 01:30 on March 9, 2016 after significant rain began, and water quality parameters began to change. The streamflow measured at USGS Gauge 08170500 increased from 245 cfs to 246 cfs during the event (USGS, 2015), it is unclear if the gauge was operating correctly during the event as a larger increase is generally observed during storm events. SWCA staff relied upon the real time instrument (RTI) data to monitor the effect of the storm on the river. A more than 20% change in specific conductivity and other water quality parameters did occur during the event and SWCA staff observed a rise in water levels at sampling locations. Therefore, the storm event is considered valid for sampling based on the guidelines in the *EAA Groundwater Quality Monitoring Plan*.

Peak sampling was initiated at approximately 04:00 on March 9, 2016. The river recovered quickly once the rain ended. Trail sampling was initiated at approximately 05:45 after specific conductivity had recovered more than 50% to base line conditions.

Filtration for the metals, dissolved organic carbon (DOC) and alkalinity samples was performed at SWCA's San Antonio office utilizing a peristaltic pump. New disposable bailers were used to collect all samples at HSM240. *E. coli* samples were delivered to a contract laboratory when it opened the morning of March 9, 2016. Due to the overnight collection of samples, it was not possible to deliver lead *E. coli* samples to a contract laboratory within the 6-hour hold time. At the conclusion of the event, samples were transported back to SWCA's San Antonio office where they were retrieved by a contract laboratory.

November 3, 2016 – A storm was forecast for the area the morning of November 3, 2016. SWCA followed the forecast and radar and deployed to the San Marcos Nature Center midday. The rain began at approximately 15:75. Lead sampling was initiated at approximately 16:15 after water quality parameters began to change. The rain ceased during the lead sample and water quality began to recover quickly, peak sampling was initiated immediately following lead sampling at approximately 17:45. Water quality reached 50% recovery and trail sampling was initiated at approximately 20:15. Sample filtration and alkalinity were performed at the San Marcos Nature Center before SWCA staff returned to the SWCA San Antonio office the morning of November 4, 2016. Due to the evening sampling times, *E. coli* samples were delivered to a contract laboratory when it opened in the morning of November 4, 2016 outside of hold time. Samples for remaining analyses were picked up from the SWCA office by laboratory staff also on the morning of November 4, 2016. New disposable bailers were used for all samples collected from HSM240.

## Qualifiers

### GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.

## Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.

## General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
F1	MS and/or MSD Recovery is outside acceptance limits.
H	Sample was prepped or analyzed beyond the specified holding time

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points

**Laboratory: TestAmerica Corpus Christi**

## Narrative

### Job Narrative 560-60073-1

#### Revised Report 1 08-11-2016

In the original report the Bicarbonate and Carbonate did not pull into the job. Test America apologizes for any inconvenience this may have caused the client.

#### Receipt

The samples were received on 3/4/2016 8:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 8 coolers at receipt time were 0.3° C, 0.7° C, 0.7° C, 0.9° C, 1.3° C, 1.4° C, 1.5° C and 1.6° C.

#### Receipt Exceptions

560-60073: TALS does not provide a description in the containers tab for 1-Liter Amber w/Ascorbic Acid. In the pH column, there noted is Ascorbic Acid for verification.

#### GC/MS VOA

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 560-125820 were outside control limits for Benzyl chloride, cis-1,4-Dichloro-2-butene, 1,1,1,2-Tetrachloroethane and 1,2,3-Trichlorobenzene. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### GC/MS Semi VOA

Method 8270C: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 560-125782 and analytical batch 560-125807 were outside control limits for Bis(2-chloroethyl)ether, 2,4-Dinitrotoluene and 2,6-Dinitrotoluene. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8270C: The method blank for preparation batch 560-125782 and analytical batch 560-125807 contained Bis(2-ethylhexyl) phthalate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### GC Semi VOA

Method 8141A: The continuing calibration verification (CCV) associated with batch 280-316439 recovered above the upper control limit for merphos on the confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: HCS110 (560-60073-1), HCS120 (560-60073-2), FDHCS120 (560-60073-3), HCS130 (560-60073-4), HCS130 (560-60073-4[MS]), HCS130 (560-60073-4[MSD]), HCS140 (560-60073-5), HCS160 (560-60073-6), (CCV 280-316439/38), (560-60051-G-1-A MS) and (560-60051-H-1-A MSD).  
8141 / A-316439 / P - 315982

CCV1: OK for all

---MB, LCS, 560-59988-1, 1MS, 1MSD

CCV2: OK for all

---560-60019-2, 2MS, 2MSD, 560-60051-1

CCV3: OK for all

---560-60051-1MS, 1MSD, 560-60073-1, 2, 3, 4, 4MS, 4MSD, 5, 6

CCV4

primary: OK for all

confirmation: merphos +17% (avg = 5%)

Method 8082A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 560-125817 and analytical batch 560-125830 were outside control limits for Aroclor 1016 and Aroclor 1260. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

## Case Narrative

Client: SWCA, Inc.  
Project/Site: 2016 Surface Water/Base Flowing

TestAmerica Job ID: 560-60073-1  
SDG: Comal Springs

### Job ID: 560-60073-1 (Continued)

#### Laboratory: TestAmerica Corpus Christi (Continued)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Metals

Method 6020: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with sample 560-60073-4 were outside acceptable limits for Antimony, Cadmium, Lead and Manganese. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### General Chemistry

Method 300.0: The following sample(s) was received with less than 2 hrs remaining on the holding time remaining on a test with a holding time of 48 hours or less. As such, the laboratory had insufficient time remaining to perform the analysis within holding time: HCS130 (560-60073-4[MS]) and HCS130 (560-60073-4[MSD]).

Method 9040C: This analysis is normally performed in the field and has a method-defined holding time of 15 minutes. The following samples have been qualified with the "HF" flag to indicate analysis was performed in the laboratory outside the 15 minute timeframe. 560-60073-1-6

Method 351.2: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with sample 560-60073-4 were outside acceptable limits for Kjeldahl Nitrogen. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Organic Prep

Method(s) 3510C: The following samples were spiked with an unverified standard.  
8141 LCS\_00096 was created on 03/04/2016.  
analytical batch 280-315982  
HCS130 (560-60073-4[MS]) and HCS130 (560-60073-4[MSD])  
Method: 3510C 8141A 8141B

When the extract was verified it was observed that the standard was made with 2mls of one of the stocks rather than the 1ml usually used. As a result, multiple analytes are spiked at a higher concentration than usual. All recoveries were within control limits in the LCS, MS, and MSDs, therefore the data has been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

*The results in this report apply to the samples analyzed in accordance with the Chain of Custody document. Weck Laboratories, Inc. certifies that the test results meet all NELAC requirements unless noted in the case narrative. This analytical report is confidential and is only intended for the use of Weck Laboratories, Inc. and its client. This report contains the Chain of Custody document, which is an integral part of it, and can only be reproduced in full with the authorization of Weck Laboratories, Inc.*

Dear Lindy Maingot :

Enclosed are the results of analyses for samples received 03/05/16 11:00 with the Chain of Custody document. The samples were received in good condition, at 2.2 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.

### Notes and Definitions

<b>MS-02</b>	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
<b>ND</b>	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then not detected at or above the MDL.
<b>NR</b>	Not Reportable
<b>Dil</b>	Dilution
<b>dry</b>	Sample results reported on a dry weight basis
<b>RPD</b>	Relative Percent Difference
<b>% Rec</b>	Percent Recovery
<b>Sub</b>	Subcontracted analysis, original report available upon request
<b>MDL</b>	Method Detection Limit
<b>MDA</b>	Minimum Detectable Activity
<b>MRL</b>	Method Reporting Limit

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California Department of Health Services.

The Reporting Limit (RL) is referenced as the Laboratory's Practical Quantitation Limit (PQL) or the Detection Limit for Reporting Purposes (DLR).

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Question	Answer	Comment
Radioactivity wasn't checked or is $\leq$ background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

This analytical report is intended exclusively for the individual or entity to which it is addressed. Recipient is not authorized to print or copy this report, except in full without written approval of the laboratory. If you have received this report in error, please notify the San Antonio River Authority.

**Sample Location:** HSM130  
**Sample Number:** AB00556  
**Sample Matrix:** Non Potable Water

**Collection Date/Time:** 3/3/16 11:39  
**Receipt Date/Time:** 3/3/16 15:12

### CASE NARRATIVE

This report provides results related only to the referenced sample ID numbers. All samples were received in acceptable condition unless otherwise noted. For questions regarding this report, please contact Greg Mateo, Laboratory Supervisor, at (210) 302-3290.

Analysis identified with a "√" complies with NELAP requirements unless otherwise specified in the case narrative.

No sample and/or analysis comment(s)

## Qualifiers

### GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

### GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
U	Indicates the analyte was analyzed for but not detected.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
H	Sample was prepped or analyzed beyond the specified holding time
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)

TestAmerica Corpus Christi

## Narrative

### Job Narrative 560-60099-1

#### Comments

No additional comments.

#### Receipt

The samples were received on 3/5/2016 9:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 10 coolers at receipt time were 0.2° C, 0.3° C, 0.5° C, 0.6° C, 0.7° C, 0.8° C, 0.8° C, 0.8° C, 1.0° C and 1.1° C.

#### Receipt Exceptions

560-60099: While logging in the containers, TALS does not provide Amber 1 Liter w/Ascorbic Acid in the list. Logged them in as "Other Client Container-Preserved" and in the pH column, there stated is "w/Ascorbic Acid."

One or more containers for the following samples were received empty. Not sure if these containers were like this during sampling or if they leaked:

560-60099-5-R (1-Liter Amber Unpreserved)  
- 8-F (1-250 Amber w/Sulfuric Acid)

#### GC/MS VOA

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### GC/MS Semi VOA

Method 8081: The relative percent deviation (RPD) was outside acceptable limits for Endrin Ketone in the MS/MSD pair associated with sample 560-60099-6. The LCS was within acceptable limits. Therefore, data are reported.

Method 8270: The relative percent deviation (RPD) was outside acceptable limits for 4-Chloroaniline in the MS/MSD pair associated with sample 560-60099-1. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### GC Semi VOA

Method 8082A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 560-125817 and analytical batch 560-125830 were outside control limits for Aroclor 1016 and Aroclor 1260. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8082A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 560-125855 and analytical batch 560-125926 were outside control limits for Aroclor 1260. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Metals

Method 6020: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 125813 were outside acceptable limits for Antimony, Cadmium and Lead. The LCS was within acceptable limits. Therefore, data are reported.

Method 6020: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 125854 were outside acceptable limits for Manganese. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### General Chemistry

Method 300.0: The following samples were received with less than 2 hrs remaining on the holding time or less than one shift (8 hours) remaining on a test with a holding time of 48 hours or less. As such, the laboratory had insufficient time remaining to perform the analysis

## Case Narrative

Client: SWCA, Inc.  
Project/Site: 2016-Surface Water/Base Flow

TestAmerica Job ID: 560-60099-1

### Job ID: 560-60099-1 (Continued)

#### Laboratory: TestAmerica Corpus Christi (Continued)

within holding time: HSM110 (560-60099-1), FDHSM110 (560-60099-2), HSM120 (560-60099-3) and HSM130 (560-60099-4). Data generated after hold time expires should be flagged accordingly.

Method 9040C: This analysis is normally performed in the field and has a method-defined holding time of 15 minutes. The following sample(s) has been qualified with the "HF" flag to indicate analysis was performed in the laboratory outside the 15 minute timeframe. 560-60099-1-8

Method 9060: Insufficient volume of sample ( # 8) was provided; analyst used neat sample and after adj. ph to < 2 run for TOC HSM170 (560-60099-8)

Method 351.2: The matrix spike (MS) recoveries for <183952> were outside control limits for TKN. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Organic Prep

Method 3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with analytical batch 280-316370.3510C 8141A

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

*The results in this report apply to the samples analyzed in accordance with the Chain of Custody document. Weck Laboratories, Inc. certifies that the test results meet all NELAC requirements unless noted in the case narrative. This analytical report is confidential and is only intended for the use of Weck Laboratories, Inc. and its client. This report contains the Chain of Custody document, which is an integral part of it, and can only be reproduced in full with the authorization of Weck Laboratories, Inc.*

Dear Lindy Maingot :

Enclosed are the results of analyses for samples received 03/08/16 09:00 with the Chain of Custody document. The samples were received in good condition, at 2.4 °C and on ice. All analysis met the method criteria except as noted below or in the report with data qualifiers.

### Notes and Definitions

<b>MS-02</b>	The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.
<b>ND</b>	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then not detected at or above the MDL.
<b>NR</b>	Not Reportable
<b>Dil</b>	Dilution
<b>dry</b>	Sample results reported on a dry weight basis
<b>RPD</b>	Relative Percent Difference
<b>% Rec</b>	Percent Recovery
<b>Sub</b>	Subcontracted analysis, original report available upon request
<b>MDL</b>	Method Detection Limit
<b>MDA</b>	Minimum Detectable Activity
<b>MRL</b>	Method Reporting Limit

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California Department of Health Services.

The Reporting Limit (RL) is referenced as the Laboratory's Practical Quantitation Limit (PQL) or the Detection Limit for Reporting Purposes (DLR).

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Job Number: 560-60099-1

**Login Number: 60099**

**List Source: TestAmerica Corpus Christi**

**List Number: 1**

**Creator: Adams, Christi L**

Question	Answer	Comment
Radioactivity wasn't checked or is $\leq$ background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	False	Refer to Job Narrative for details.
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

# Definitions/Glossary

Client: SWCA, Inc.  
Project/Site: Comal Springs

TestAmerica Job ID: 560-63683-1

## Qualifiers

### GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.

## Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## General Chemistry

Qualifier	Qualifier Description
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points

**Job ID: 560-63683-1**

**Laboratory: TestAmerica Corpus Christi**

## Narrative

### Job Narrative 560-63683-1

#### **Revised Report 1 10-19-2016**

The client requested a change for the units for 8260 and 6020. No other changes were made.

#### **Receipt**

The samples were received on 9/9/2016 8:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 7 coolers at receipt time were 0.5° C, 0.8° C, 0.9° C, 1.0° C, 2.1° C, 2.3° C and 2.7° C.

#### **GC/MS VOA**

Method 8260: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 131652 were outside acceptable limits for Ethylene oxide. The LCS was within acceptable limits. Therefore, data are reported.

Method 8260: The relative percent deviation (RPD) was outside acceptable limits for Napthalene in the MS/MSD pair associated with batch 131652. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### **GC/MS Semi VOA**

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### **GC Semi VOA**

The continuing calibration verification (CCV) associated with batch 280-345779 recovered outside acceptance criteria, low biased, for Naled. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

CCV1 (front) OK (back) Ethoprop -17% AVE=10.8

MB, LCS, LCSD, 560-63683-1, -2, -3, -4

CCV2 (front) Dichlorvos +20% EPN -20% Naled -60% AVE=8.5 (back) Azinphos-methyl -23% EPN -18% Dichlorvos +22% Naled -64% Trichloronate -18% AVE=12.7

560-63683-5, -6, 560-63698-2, -3, -4, -5, -6, -7, -8

CCV3 (front) Dichlorvos +20% Naled -50% AVE=8.5 (back) Azinphos-methyl -16% Dimethoate -16% Ethoprop -18% Methyl parathion -17% Naled -56% AVE=12.7

Method 8151: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 449637 were outside acceptable limits for Dalapon. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### **Metals**

Method 6010B: The method blank for preparation batch 560-131669 and analytical batch 560-131706 contained Sr above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 6020: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 131750 were outside acceptable limits for Aluminum. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### **General Chemistry**

Method 9040C: This analysis is normally performed in the field and has a method-defined holding time of 15 minutes. The following samples has been qualified with the "HF" flag to indicate analysis was performed in the laboratory outside the 15 minute timeframe: HCS110 (560-63683-1), HCS120 (560-63683-2), FDHCS120 (560-63683-3), HCS130 (560-63683-4), HCS140 (560-63683-5) and HCS160 (560-63683-6).

## Case Narrative

Client: SWCA, Inc.  
Project/Site: Comal Springs

TestAmerica Job ID: 560-63683-1

### Job ID: 560-63683-1 (Continued)

#### Laboratory: TestAmerica Corpus Christi (Continued)

Method 351.2: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 196723 were outside acceptable limits for Kjeldahl Nitrogen. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Organic Prep

Method 3510C: 8141 LCS\_00104 was not verified prior to use. LCS is in the process of verification.

HCS110 (560-63683-1), HCS120 (560-63683-2), FDHCS120 (560-63683-3), HCS130 (560-63683-4), HCS130 (560-63683-4[MS]), HCS130 (560-63683-4[MSD]), HCS140 (560-63683-5) and HCS160 (560-63683-6)

Batch: 342098

Method: 3510C/8141A

Method 3510C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 280-344652.

3510C 8141A

344652

Method 3510C: The following samples were spiked with a unverified standards.

8141 Surr\_00079 & 8141 LCS\_000112

HCS110 (560-63683-1), HCS120 (560-63683-2), FDHCS120 (560-63683-3), HCS130 (560-63683-4), HCS140 (560-63683-5) and HCS160 (560-63683-6)

preparation batch 280-344652.

3510C 8141A

344652

Method 3510C: The following samples was re-prepared outside of preparation holding time due to LCS Failure.

HCS110 (560-63683-1), HCS120 (560-63683-2), FDHCS120 (560-63683-3), HCS130 (560-63683-4), HCS140 (560-63683-5) and HCS160 (560-63683-6).

preparation batch 280-344652.

3510C 8141A

344652

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Login Sample Receipt Checklist

Client: SWCA, Inc.

Job Number: 560-63683-1

Login Number: 63683

List Source: TestAmerica Corpus Christi

List Number: 1

Creator: Escalona-Garcia, Jose A

Question	Answer	Comment
Radioactivity wasn't checked or is $\leq$ background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

*Results relate only to the items tested and the sample(s) as received by the laboratory.*

## Definitions/Glossary

Client: SWCA, Inc.  
Project/Site: Comal Springs

TestAmerica Job ID: 560-63683-2

### Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## Comments

No additional comments.

## Receipt

The samples were received on 9/9/2016 8:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 7 coolers at receipt time were 0.5° C, 0.8° C, 0.9° C, 1.0° C, 2.1° C, 2.3° C and 2.7° C.

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

# Certification Summary

Dear Lindy Maingot,

Enclosed are the results of analyses for samples received 9/13/16 with the Chain-of-Custody document. The samples were received in good condition, at 2.3 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

# Certificate of Analysis

FINAL REPORT

**Reported:**

10/27/2016 09:16

## Notes and Definitions

Item	Definition
MS-05	The spike recovery and/or RPD were outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
Dil	Dilution
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
% Rec	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ) and Detection Limit for Reporting (DLR)
MDA	Minimum Detectable Activity
NR	Not Reportable
TIC	Tentatively Identified Compound (TIC) using mass spectrometry. The reported concentration is relative concentration based on the nearest internal standard. If the library search produces no matches at, or above 85%, the compound is reported as unknown.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California State Water Resources Control Board (SWRCB)

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS 002.

## Login Sample Receipt Checklist

Client: SWCA, Inc.

Job Number: 560-63683-2

Login Number: 63683

List Source: TestAmerica Corpus Christi

List Number: 1

Creator: Escalona-Garcia, Jose A

Question	Answer	Comment
Radioactivity wasn't checked or is $\leq$ background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

## Definitions/Glossary

Client: SWCA, Inc.  
Project/Site: EAA Sampling

TestAmerica Job ID: 560-64579-1

### Qualifiers

#### GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.
X	Surrogate is outside control limits

### Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

# Case Narrative

Client: SWCA, Inc.  
Project/Site: EAA Sampling

TestAmerica Job ID: 560-64579-1

**Job ID: 560-64579-1**

**Laboratory: TestAmerica Corpus Christi**

## Narrative

### Job Narrative 560-64579-1

#### Comments

No additional comments.

#### Receipt

The samples were received on 10/25/2016 8:55 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.3° C.

#### GC Semi VOA

Method 8141A: The Triphenylphosphate surrogate recovery for the following sample in preparation batch 280-349084 and analytical batch 280-350765 was outside acceptance limits (low biased) on the back/confirmation column: HSM120 (560-64579-3). The recovery is within acceptance limits on the other column, indicating that the extraction process was in control.

Method 8141A: Surrogate Chlormefos recovery for the following sample in preparation batch 280-349084 and analytical batch 280-350765 was outside control limits: HSM150 (560-64579-6). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8141A: The continuing calibration verification (CCV) for Dimethoate associated with analytical batch 280-350765 recovered above the upper control limit on the back/confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported from the front/primary column which is in control.

(CCV 280-350765/45)

CCV2 (front) OK (back) OK

560-64578-5, -6, 560-64579-1, -2, -3, -4, -5, -6, -7, -8

CCV3 (front) OK (back) Dimethoate +17%

Method 8141A, 8141B: The initial calibration verification (ICV) for Dichlorvos, Mevinphos and Azinphos-methyl associated with analytical batch 280-350765 recovered outside the control limit on one column. The samples associated with this ICV were non-detects for the affected analytes; therefore, the data have been reported from the column which is in control.

ICV (front) Dichlorvos +20% (back) Mevinphos -16% Azinphos-methyl +17%

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Organic Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Detection Summary

Client: SWCA, Inc.

## Login Sample Receipt Checklist

Client: SWCA, Inc.

Job Number: 560-64579-1

Login Number: 64579

List Source: TestAmerica Corpus Christi

List Number: 1

Creator: Escalona-Garcia, Jose A

Question	Answer	Comment
Radioactivity wasn't checked or is $\leq$ background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

# Definitions/Glossary

Client: SWCA, Inc.  
Project/Site: San Marcos Springs

TestAmerica Job ID: 560-63698-1

## Qualifiers

### GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
*	LCS or LCSD is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.

### GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.

## Metals

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

## General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio

TestAmerica Corpus Christi

## Definitions/Glossary

Client: SWCA, Inc.  
Project/Site: San Marcos Springs

TestAmerica Job ID: 560-63698-1

### Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

# Case Narrative

**Laboratory: TestAmerica Corpus Christi**

## Narrative

### Job Narrative 560-63698-1

#### Comments

No additional comments.

#### Receipt

The samples were received on 9/10/2016 9:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 8 coolers at receipt time were 0.0° C, 0.1° C, 0.1° C, 0.3° C, 0.4° C, 0.5° C, 0.6° C and 0.8° C.

#### GC/MS VOA

Method 8260B: The laboratory control sample (LCS) for analytical batch 560-131686 recovered outside control limits for the following analytes: Chloromethane and Butadiene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 560-131686 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### GC/MS Semi VOA

Method 8270C: The method blank for preparation batch 560-131740 and analytical batch 560-131758 contained Di-n-butyl phthalate above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### GC Semi VOA

Method 8151: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with sample 560-63698-8 were outside acceptable limits for Dalapon. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Metals

Method 6010: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 131706 were outside acceptable limits for Calcium. The LCS was within acceptable limits. Therefore, data are reported/

Method 6020: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 131750 were outside acceptable limits for Aluminum. The LCS was within acceptable limits. Therefore, data are reported/

No additional analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### General Chemistry

Method 9040C: This analysis is normally performed in the field and has a method-defined holding time of 15 minutes. The following samples have been qualified with the "HF" flag to indicate analysis was performed in the laboratory outside the 15 minute timeframe. 560-63698-1-8

Method 351.2: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with sample 560-63698-7 were outside acceptable limits for Kjeldahl Nitrogen. The LCS was within acceptable limits. Therefore, data are reported.

Method 351.2 : The relative percent deviation (RPD) was outside acceptable limits for Kjeldahl Nitrogen in the MS/MSD pair associated with sample 560-63698-7. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Case Narrative

Client: SWCA, Inc.  
Project/Site: San Marcos Springs

TestAmerica Job ID: 560-63698-1

---

### Job ID: 560-63698-1 (Continued)

---

#### Laboratory: TestAmerica Corpus Christi (Continued)

##### Organic Prep

Method 3520C: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 560-131740.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

List Number: 1

Creator: Escalona-Garcia, Jose A

Question	Answer	Comment
Radioactivity wasn't checked or is $\leq$ background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

## Definitions/Glossary

Client: SWCA, Inc.  
Project/Site: San Marcos Springs

TestAmerica Job ID: 560-63698-2

### Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## Comments

No additional comments.

## Receipt

The samples were received on 9/10/2016 9:45 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 8 coolers at receipt time were 0.0° C, 0.1° C, 0.1° C, 0.3° C, 0.4° C, 0.5° C, 0.6° C and 0.8° C.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

# Certification Summary

*This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.*

Dear Lindy Maingot,

Enclosed are the results of analyses for samples received 9/13/16 with the Chain-of-Custody document. The samples were received in good condition, at 2.3 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

## Notes and Definitions

Item	Definition
MS-05	The spike recovery and/or RPD were outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
Dil	Dilution
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
% Rec	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
MDL	Method Detection Limit
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ) and Detection Limit for Reporting (DLR)
MDA	Minimum Detectable Activity
NR	Not Reportable
TIC	Tentatively Identified Compound (TIC) using mass spectrometry. The reported concentration is relative concentration based on the nearest internal standard. If the library search produces no matches at, or above 85%, the compound is reported as unknown.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

An Absence of Total Coliform meets the drinking water standards as established by the California State Water Resources Control Board (SWRCB)

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS 002.

## Definitions/Glossary

Client: SWCA, Inc.  
Project/Site: EAA Sampling

TestAmerica Job ID: 560-64578-1

### Qualifiers

#### GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
D	Sample results are obtained from a dilution; the surrogate or matrix spike recoveries reported are calculated from diluted samples.
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## Narrative

### Job Narrative 560-64578-1

#### Comments

No additional comments.

#### Receipt

The samples were received on 10/25/2016 8:55 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.1° C.

#### GC Semi VOA

Method 8141A: The continuing calibration verification (CCV) for Dimethoate associated with analytical batch 280-350765 recovered above the upper control limit on the back/confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported from the front/primary column which is in control.

(CCV 280-350765/45)

CCV2 (front) OK (back) OK

560-64578-5, -6, 560-64579-1, -2, -3, -4, -5, -6, -7, -8

CCV3 (front) OK (back) Dimethoate +17%

Method 8141A, 8141B: The initial calibration verification (ICV) for Dichlorvos, Mevinphos and Azinphos-methyl associated with analytical batch 280-350765 recovered outside the control limit on one column. The samples associated with this ICV were non-detects for the affected analytes; therefore, the data have been reported from the column which is in control.

ICV (front) Dichlorvos +20% (back) Mevinphos -16% Azinphos-methyl +17%

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Organic Prep

Method 3510C: 8141 LCS\_00113 standard was not verified at the time of spiking. An aliquot has been sent for verification. preparation batch 280-349084

Method: 3510C8141A/B

Batch: 349084

HCS130 (560-64578-4[MS]) and HCS130 (560-64578-4[MSD])

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

## Login Sample Receipt Checklist

Client: SWCA, Inc.

Job Number: 560-64578-1

Login Number: 64578

List Source: TestAmerica Corpus Christi

List Number: 1

Creator: Escalona-Garcia, Jose A

Question	Answer	Comment
Radioactivity wasn't checked or is $\leq$ background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4").	N/A	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

**Sample Number:** AB01440  
**Sample Matrix:** Non Potable Water

**Collection Date/Time:** 4/12/16 23:20  
**Receipt Date/Time:** 4/13/16 11:38

### CASE NARRATIVE

This report provides results related only to the referenced sample ID numbers. All samples were received in acceptable condition unless otherwise noted. For questions regarding this report, please contact Greg Mateo, Laboratory Supervisor, at (210) 302-3290.

Analysis identified with a "√" complies with NELAP requirements unless otherwise specified in the case narrative.

**Sample Comments:** Per customer analyze regardless of hold time. Exceeded hold time.

This analytical report is intended exclusively for the individual or entity to which it is addressed. Recipient is not authorized to print or copy this report, except in full without written approval of the laboratory. If you have received this report in error, please notify the San Antonio River Authority.

**Sample Location:** FDHCS 270 TRAIL  
**Sample Number:** AB01461  
**Sample Matrix:** Non Potable Water

**Collection Date/Time:** 4/13/16 08:43  
**Receipt Date/Time:** 4/13/16 11:38

### CASE NARRATIVE

This report provides results related only to the referenced sample ID numbers. All samples were received in acceptable condition unless otherwise noted. For questions regarding this report, please contact Greg Mateo, Laboratory Supervisor, at (210) 302-3290.

Analysis identified with a "√" complies with NELAP requirements unless otherwise specified in the case narrative.

**Sample Comments:** Per customer analyze regardless of hold time.

## Qualifiers

### GC/MS VOA

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits
U	Indicates the analyte was analyzed for but not detected.

### GC/MS Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

### GC Semi VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits

## Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

## General Chemistry

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.
HF	Field parameter with a holding time of 15 minutes. Test performed by laboratory at client's request.
B	Compound was found in the blank and sample.

## Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
α	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio

## Definitions/Glossary

Client: SWCA, Inc.  
Project/Site: 2016 - Stormwater Sampling

TestAmerica Job ID: 560-60893-1

### Glossary (Continued)

Abbreviation	These commonly used abbreviations may or may not be present in this report.
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

## Narrative

### Job Narrative 560-60893-1

#### Comments

No additional comments.

#### Receipt

The samples were received on 4/14/2016 8:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 22 coolers at receipt time were 0.4° C, 0.4° C, 0.6° C, 0.7° C, 1.1° C, 1.1° C, 1.2° C, 1.2° C, 1.6° C, 1.6° C, 1.7° C, 2.1° C, 2.1° C, 2.2° C, 2.3° C, 2.5° C, 2.7° C, 2.8° C, 3.3° C, 3.4° C, 3.6° C and 4.7° C.

#### Receipt Exceptions

Containers for metals analysis were not received. Per client request, samples were poured off from 2 unpreserved 250mL amber containers into 2 - 250mL nitric preserved containers.

HCS210 LEAD (560-60893-1), HCS240 LEAD (560-60893-2), HCS250 LEAD (560-60893-3), HCS260 LEAD (560-60893-4), HCS270 LEAD (560-60893-5), TB06 (560-60893-6), HCS210 PEAK (560-60893-7), HCS240 PEAK (560-60893-8), HCS250 PEAK (560-60893-9), HCS260 PEAK (560-60893-10), HCS270 PEAK (560-60893-11), HCS210 PEAK (560-60893-12), HCS240 PEAK (560-60893-13), HCS250 PEAK (560-60893-14), HCS260 PEAK (560-60893-15), HCS270 PEAK (560-60893-16), HCS210 TRAIL (560-60893-17), HCS210 TRAIL (560-60893-17[MS]), HCS210 TRAIL (560-60893-17[MSD]), HCS240 TRAIL (560-60893-18), HCS250 TRAIL (560-60893-19), HCS260 TRAIL (560-60893-20), FDHCS260 TRAIL (560-60893-21), HCS270 TRAIL (560-60893-22) and FDHCS270 TRAIL (560-60893-23)

#### GC/MS VOA

Method 8260: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with sample 560-60893-17 were outside acceptable limits for Ethylene Oxide and 3,3-Dichlorobenzene. The LCS was within acceptable limits. Therefore, data are reported.

Method 8260: The relative percent deviation (RPD) was outside acceptable limits for Cyclohexane, 1,4-Dioxane and 4-Chloroaniline in the MS/MSD pair associated with sample 560-60893-17. The LCS was within acceptable limits. Therefore, data are reported.

Method 8260: The relative percent deviation (RPD) was outside acceptable limits for Acetonitrile, 1,4-Dioxane, Isobutyl Alcohol and 2-Nitropropane in the MS/MSD pair associated with batch 126945. The LCS was within acceptable limits. Therefore, data are reported.

Method 8260: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 126945 were outside acceptable limits for Ethylene Oxide, Isooctane and 2-Nitropropane. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### GC/MS Semi VOA

Method 8081: Percent recovery results for the MS, the MSD or the MS/MSD pair associated with sample 560-60893-17 were outside acceptable limits for Aldrin and 4,4-DDE. The LCS was within acceptable limits. Therefore, data are reported.

Method 8081: The relative percent deviation (RPD) was outside acceptable limits for 4,4-DDE and 4,4-DDT in the MS/MSD pair associated with sample 560-60893-17. The LCS was within acceptable limits. Therefore, data are reported.

Method 8082: The relative percent deviation (RPD) was outside acceptable limits for Aroclor 1260 in the MS/MSD pair associated with sample 560-60893-17. The LCS was within acceptable limits. Therefore, data are reported.

Method 8270: Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 126982 were outside acceptable limits for 3,3-Dichlorobenzidine. The LCS was within acceptable limits. Therefore, data are reported.

Method 8027: The relative percent deviation (RPD) was outside acceptable limits for 4-Chloroaniline in the MS/MSD pair associated with batch 126982. The LCS was within acceptable limits. Therefore, data are reported.

No additional analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

#### GC Semi VOA

## Case Narrative

Client: SWCA, Inc.  
Project/Site: 2016 - Stormwater Sampling

TestAmerica Job ID: 560-60893-1

### Job ID: 560-60893-1 (Continued)

#### Laboratory: TestAmerica Corpus Christi (Continued)

Method 8141A: The grand mean exception, as outlined in EPA method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 280-321945. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average %D (the grand mean) of all the compounds in the CCV is less than or equal to 15%D. The affected analytes are reported from the confirmation column. Dichlorvos and mevinphos are ND in the associated samples and chlormefos is within control limits.

8141 / A-321945 / P321359

#### CCV1

Primary: chlormefos +18%, dichlorvos +18%, mevinphos +18% (avg = 10%)

Confirmation: OK for all

---MB, LCS, 560-60839-1, 2, 3, 4, 5, 7, 8, 9, 10

CCV2: OK for all

---560-60839-11, 17, 17MS, 17MSD, 18, 19, 20, 21, 22, 23

CCV3: OK for all

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Metals

Method 6020: The continuing calibration verification (CCV) associated with batch 560-127077 recovered above the upper control limit for As, Be. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: HCS210 LEAD (560-60893-1), HCS240 LEAD (560-60893-2), HCS250 LEAD (560-60893-3), HCS260 LEAD (560-60893-4), HCS270 LEAD (560-60893-5), HCS210 PEAK (560-60893-7), HCS240 PEAK (560-60893-8), HCS250 PEAK (560-60893-9), HCS260 PEAK (560-60893-10), HCS270 PEAK (560-60893-11) and (560-60893-L-17-A SD).

Method 6020: The continuing calibration verification (CCV) associated with batch 560-127077 recovered above the upper control limit for Be. The samples associated with this CCV were non-detects for the affected analytes, therefore, the data have been reported. The following samples are impacted: HCS210 TRAIL (560-60893-17), HCS210 TRAIL (560-60893-17[MS]), HCS210 TRAIL (560-60893-17[MSD]), (LCS 560-127043/2-A) and (MB 560-127043/1-A).

Method 7470A: The method blank for preparation batch 560-127318 and analytical batch 560-127319 contained Hg above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 7470A: The method blank for preparation batch 560-127178 and 560-127318 and analytical batch 560-127319 contained Hg above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method(s) 6020: The method blank for preparation batch 560-127178 and 560-127043 and analytical batch 560-127077 contained Se above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### General Chemistry

Method 9040C: This analysis is normally performed in the field and has a method-defined holding time of 15 minutes. The following samples have been qualified with the "HF" flag to indicate analysis was performed in the laboratory outside the 15 minute timeframe. 560-60893-1,2,3,4,5,7,8,9,10,11,17,18,19,20,21,22 and 23.

Method 300.0: The method blank for Analytical Batch # 126986 contained chloride above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

#### Organic Prep

Method 3510C/8141A: The following sample formed emulsions during the extraction procedure: HCS210 LEAD (560-60893-1). The

## Case Narrative

#### Laboratory: TestAmerica Corpus Christi (Continued)

emulsions were broken up using a centrifuge on the first extraction and a pour back method on the second extraction. (analytical batch 280-321359)

Method 3510C: The following samples formed emulsions during the extraction procedure: HCS210 PEAK (560-60893-7), HCS210 TRAIL (560-60893-17), HCS210 TRAIL (560-60893-17[MS]) and HCS210 TRAIL (560-60893-17[MSD]). The emulsions were broken up using a centrifuge on the first extraction.

Method 3520C: Elevated reporting limits are provided for the following sample 560-60893-3 due to insufficient sample provided for 3520c preparation/analysis: 560-60893 Batch 126979

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.
