# Client Sample Results

Client: SWCA, Inc.  
Project/Site: Sediment Sampling

TestAmerica Job ID: 560-62041-1

**Client Sample ID: HSM360**

**Date Collected: 06/09/16 12:28**

**Date Received: 06/10/16 08:00**

**Lab Sample ID: 560-62041-6**

**Matrix: Solid**

**Percent Solids: 72.1**

## Method: 8260B - Volatile Organic Compounds (GC/MS) (Continued)

# Client Sample Results

Client: SWCA, Inc.  
Project/Site: Sediment Sampling

TestAmerica Job ID: 560-62041-1

**Client Sample ID: EB01**  
**Date Collected: 06/09/16 16:15**  
**Date Received: 06/10/16 08:00**

**Lab Sample ID: 560-62041-10**  
**Matrix: Water**

## Method: 8260B - Volatile Organic Compounds (GC/MS) (Continued)

TestAmerica Corpus Christi

# QC Sample Results

Client: SWCA, Inc.  
Project/Site: Sediment Sampling

TestAmerica Job ID: 560-62041-1

## Method: 8260B - Volatile Organic Compounds (GC/MS) (Continued)

Lab Sample ID: MB 560-128952/8

Matrix: Solid

Analysis Batch: 128952

Client Sample ID: Method Blank

Prep Type: Total/NA

TestAmerica Corpus Christi

# QC Sample Results

Client: SWCA, Inc.  
Project/Site: Sediment Sampling

TestAmerica Job ID: 560-62041-1

## Method: 8270C - Semivolatile Organic Compounds (GC/MS) (Continued)

Lab Sample ID: MB 560-128987/1-A

Matrix: Water

Analysis Batch: 129026

Client Sample ID: Method Blank

Prep Type: Total/NA

Prep Batch: 128987

| Question   | Answer | Comment                             |
|--|--------|-------------------------------------|
| Radioactivity wasn't checked or is $\leq$ background as measured by a survey meter.      | N/A    |                                     |
| The cooler's custody seal, if present, is intact.  | True   |                                     |
| Sample custody seals, if present, are intact.  | True   |                                     |
| The cooler or samples do not appear to have been compromised or tampered with.           | True   |                                     |
| Samples were received on ice.  | True   |                                     |
| Cooler Temperature is acceptable.  | True   |                                     |
| Cooler Temperature is recorded.  | True   |                                     |
| COC is present.  | True   |                                     |
| COC is filled out in ink and legible.  | True   |                                     |
| COC is filled out with all pertinent information.  | True   |                                     |
| Is the Field Sampler's name present on COC?  | True   |                                     |
| There are no discrepancies between the containers received and the COC.                  | False  | Refer to Job Narrative for details. |
| Samples are received within Holding Time (excluding tests with immediate HTs)            | True   |                                     |
| Sample containers have legible labels.   | True   |                                     |
| Containers are not broken or leaking.  | True   |                                     |
| Sample collection date/times are provided.   | True   |                                     |
| Appropriate sample containers are used.  | True   |                                     |
| Sample bottles are completely filled.  | True   |                                     |
| Sample Preservation Verified.  | True   |                                     |
| There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs         | True   |                                     |
| Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ (1/4"). | N/A    |                                     |
| Multiphasic samples are not present.   | True   |                                     |
| Samples do not require splitting or compositing.   | True   |                                     |
| Residual Chlorine Checked.   | N/A    |                                     |

*Results relate only to the items tested and the sample(s) as received by the laboratory.*

## Definitions/Glossary

Client: SWCA, Inc.  
Project/Site: 2016 - Sediment Sampling

TestAmerica Job ID: 560-62094-1  
SDG: San Marcos Springs

### Qualifiers

#### Metals

| Qualifier | Qualifier Description  |
|-----------|--|
| U         | Indicates the analyte was analyzed for but not detected.   |
| J         | Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value. |

### Glossary

| Abbreviation   | These commonly used abbreviations may or may not be present in this report.                                 |
|----------------|---|
| α              | Listed under the "D" column to designate that the result is reported on a dry weight basis                  |
| %R             | Percent Recovery  |
| CFL            | Contains Free Liquid  |
| CNF            | Contains no Free Liquid   |
| DER            | Duplicate error ratio (normalized absolute difference)  |
| Dil Fac        | Dilution Factor   |
| DL, RA, RE, IN | Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample |
| DLC            | Decision level concentration  |
| MDA            | Minimum detectable activity   |
| EDL            | Estimated Detection Limit   |
| MDC            | Minimum detectable concentration  |
| MDL            | Method Detection Limit  |
| ML             | Minimum Level (Dioxin)  |
| NC             | Not Calculated  |
| ND             | Not detected at the reporting limit (or MDL or EDL if shown)  |
| PQL            | Practical Quantitation Limit  |
| QC             | Quality Control   |
| RER            | Relative error ratio  |
| RL             | Reporting Limit or Requested Limit (Radiochemistry)   |
| RPD            | Relative Percent Difference, a measure of the relative difference between two points                        |
| TEF            | Toxicity Equivalent Factor (Dioxin)   |
| TEQ            | Toxicity Equivalent Quotient (Dioxin)   |

## Case Narrative

Client: SWCA, Inc.  
Project/Site: 2016 - Sediment Sampling

TestAmerica Job ID: 560-62094-1  
SDG: San Marcos Springs

**Job ID: 560-62094-1**

**Laboratory: TestAmerica Corpus Christi**

### Narrative

**Job Narrative**  
**560-62094-1**

### Comments

No additional comments.

### Receipt

The samples were received on 6/15/2016 7:43 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.0° C.

### Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

## Detection Summary

Client: SWCA, Inc.  
Project/Site: 2016 - Sediment Sampling

TestAmerica Job ID: 560-62094-1  
SDG: San Marcos Springs

### Client Sample ID: EB01

### Lab Sample ID: 560-62094-1

| Analyte            | Result | Qualifier | RL    | MDL    | Unit | Dil Fac | D | Method | Prep Type |
|--------------------|--------|-----------|-------|--------|------|---------|---|--------|-----------|
| Silicon, Dissolved | 0.217  | J         | 0.500 | 0.0707 | mg/L | 1       |   | 6010B  | Dissolved |
| Sodium, Dissolved  | 0.539  | J         | 1.00  | 0.310  | mg/L | 1       |   | 6010B  | Dissolved |

### Client Sample ID: EB02

### Lab Sample ID: 560-62094-2

| Analyte            | Result | Qualifier | RL    | MDL    | Unit | Dil Fac | D | Method | Prep Type |
|--------------------|--------|-----------|-------|--------|------|---------|---|--------|-----------|
| Calcium, Dissolved | 0.112  | J         | 0.200 | 0.101  | mg/L | 1       |   | 6010B  | Dissolved |
| Silicon, Dissolved | 0.299  | J         | 0.500 | 0.0707 | mg/L | 1       |   | 6010B  | Dissolved |
| Sodium, Dissolved  | 0.549  | J         | 1.00  | 0.310  | mg/L | 1       |   | 6010B  | Dissolved |

This Detection Summary does not include radiochemical test results.

# Laboratory Report

Site: Comal and San Marcos Rivers

Prepared for:

SWCA Environmental  
10245 Little York Road  
Suite 600  
Houston, TX

Prepared on:  
March 02, 2016

## Project Summary and Objective

Amplified Geochemical Imaging, LLC. (AGI) provided the AGI Environmental Survey used at:

**Comal and San Marcos Rivers**

The service provided by AGI included delivery of the required quantity of AGI Universal Samplers, analysis by the method described below for the requested organic compounds, reporting of the data, and contour mapping (as needed).

This report includes results for only the samples noted under the Laboratory Sample Report section. If contour maps are part of the project deliverable, the maps will be prepared and issued under a separate report cover, upon receipt of a usable sitemap (electronic) and compound choices for contouring.

Written/submitted by:

**Kelly J Stringham**

Project Manager

Reviewed/approved by:

**Dayna M Cobb**

Analytical data approved by:

**Jasmine Smith**

Chemist

## Quality Assurance Statement

The AGI Laboratory, at Amplified Geochemical Imaging's facility in Newark, DE USA, operates under the guidelines of its ISO Standard 17025 DoD ELAP accreditation, and its Quality Assurance Manual, Operating Procedures, and Methods (SOP-QA-0462).

For this project, the analytical method, results, and observations reported do ☐ do not ☒ fall within the scope of AGI's ISO 17025 accreditation.

### Screening/Concentration Method

The AGI Universal Samplers are analyzed at AGI's fixed laboratory using thermal desorption-gas chromatography/mass spectrometry (TD-GC/MS) instrumentation following modified U.S. EPA Method 8260 (SPG-WI-0292) which includes the following:

- ☐ **BFB Tuning Frequency:** A BFB tune is analyzed at the start of each analytical run and after every 30 samples.
- ☐ **Initial Calibration:** A minimum of a five point calibration curve is analyzed prior to the analysis of samples.
- ☐ **Initial Calibration Verification (ICV):** Following the calibration a second-source reference standard is analyzed to verify the accuracy of the calibration. Acceptance criteria for the ICV is +/- 30%.
- ☐ **Linearity of Target Compounds:** If the RSD of any target analyte is less than or equal to 25% then average response factor can be used for quantitation. If the RSD exceeds 25% for a target compound a regression equation can be used for quantitation.
- ☐ **Continuing Calibration Verification:** After every 10 samples, and at the end of each analytical batch, a mid-level second-source Reference Standard is analyzed. The acceptance criteria for all target analytes in the reference standards are +/- 50% of the true value.
- ☐ **Method Blank:** Analyzed prior to the analysis of field samples and every 30 samples.

**Note:** Analyte levels reported for the field-deployed AGI Universal Samplers that exceed trip and method blank levels, and/or the reporting limit, are more likely to have originated from on-site sources.

|                            |               |

| Comments:           | None  |                      |

1 - Installation start to end of retrieval, as reported. See installation and retrieval log for individual deployment and retrieval dates and times (i.e., sampler exposure time).

## General Comments

### Analytical QA/QC

Laboratory instrumentation consists of gas chromatographs equipped with mass selective detectors, coupled with automated thermal desorption units. Sample preparation involves cutting the tip off the bottom of the AGI Universal Sampler, and transferring one or more "sorbents" to a thermal desorption tube for analysis. The insertion/retrieval cord prevents soil, water and other interferences from coming in contact with the adsorbent. No further sample preparation is required. Any replicate sorbents not consumed in the initial analysis will be discarded fifteen (15) days from the date of the laboratory report.

Data are archived and stored in a secure manner as per AGI's Quality Assurance program (SOP-A-0462).

Total petroleum hydrocarbons (TPH), gasoline-range petroleum hydrocarbons (GRPH), and/or diesel range petroleum hydrocarbons (DRPH), when reported, are calculated using the area under the peaks observed in m/z 55 and 57 selected ion chromatograms. Quantitation of the mass values was performed using the response factor for a specific alkane (present in the calibration standards). TPH values include the entire chromatogram and provide estimates for aliphatic hydrocarbon ranges of C4 to C20. GRPH and DRPH include only the relevant regions of the chromatograms and provide estimates for C4 to C10 and C10 to C20 aliphatic hydrocarbons, respectively.

Trip blanks were provided to document potential exposures that were not part of the signal of interest (e.g., impact during sampler shipment, installation and/or retrieval, and storage). The trip blanks are identically manufactured and packaged AGI Universal Samplers to those samplers deployed in the field. The trip blanks remain unopened during all phases of the project. Levels reported on the trip blanks may indicate potential impact to the samplers other than the contaminant source of interest.

Unresolved peak envelopes (UPEs) are represented as a series of compound peaks clustered together around a central gas chromatograph elution time in the total ion chromatogram. UPEs may be indicative of complex fluid mixtures. UPEs observed early in the chromatograms are considered to indicate presence of more volatile fluids, while UPEs observed later in the chromatogram may indicate the presence of less volatile fluids. Multiple UPEs may indicate the presence of multiple complex fluids.

Total ion chromatograms (TICs) are included in the Attachments. The eight-digit serial number of each sampler is incorporated in the TIC identification (e.g., 12345678.D represents AGI Universal Sampler 12345678).

## General Comments

### Soil Gas Sampling

For soil gas sampling, the AGI Environmental Survey reports mass levels migrating through the open pore spaces of the soil and diffusing through the sampler membrane for sorption by the engineered, hydrophobic adsorbents, housed within the membrane tube. During the migration of the soil gas away from the source to the AGI Universal Sampler, the vapors are subject to a variety of attenuation factors. The soil gas masses reported on the samplers compare favorably with the concentrations reported in the soil or groundwater (e.g., where soil gas levels are reported at greater levels to other sampled locations on the site, the matrix data should reveal the same pattern, and vice versa). However, due to a variety of factors, a perfect comparison between matrix data and soil gas levels can rarely be achieved.

Soil gas concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

Soil gas signals reported by this method cannot be correlated specifically to soil adsorbed, groundwater, and /or free-phase contamination. The soil gas signal reported from each AGI Universal Sampler can evolve from all of these sources. Differentiation between soil and groundwater contamination can only be achieved with prior knowledge of the site history (i.e., the site is known to have groundwater contamination only).

### Air Sampling

For indoor, outdoor, and crawlspace air sampling, the AGI Environmental Survey reports mass levels present in the air and diffusing through the sampler membrane for sorption by the engineered adsorbents housed within the membrane tube.

Air concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

### Groundwater and Sediment Porewater Sampling

For groundwater and sediment porewater sampling, the AGI Environmental Survey reports the mass levels of compounds present in the water which, when coming in contact with the sampler membrane, partitions out of solution, and diffuses through the sampler membrane for sorption by the engineered adsorbents.

Water concentrations ( $\mu\text{g}/\text{L}$ ) are calculated using the quantified mass, exposure period and the compound specific uptake rate. The rates were measured under controlled experimental conditions. The uptake rates are corrected for water pressure (depth of the AGI Universal Sampler below the water table), water temperature and the aquifer flow rate. For sediment porewater, the uptake rate is corrected for the reduced volume of water in the sediment, by multiplying the uptake rate by the pore water fraction.

## SUMMARY OF SAMPLING RATE CALIBRATION FOR AGI UNIVERSAL SAMPLER IN AQUEOUS PHASES

### INTRODUCTION:

The Amplified Geochemical Imaging, LLC (AGI) passive vapor sampler is designed to be used for soil gas, water, sediment pore water, and air sampling. This document describes the process used to calibrate the sampler's compound specific sampling or uptake rates in aqueous phases.

Sampling rates are measured following AGI's "Standard Practice for Determining the Sampling Rate of Passive Diffusion Samplers in Various Environmental Media": SPG-SOP-0493. Rates are used to calculate dissolved phase concentrations of volatile and semi-volatile contaminants in water. The calibration process is summarized in three parts: Part 1: shallow water, Part 2: deep water, and Part 3: sediment.

### PURPOSE:

The purpose of this document is to:

1. Summarize the test protocol,
2. Summarize the methodology for analysis of data,
3. Present general results for generating concentration calibration of the AGI Universal Sampler

### Principle of Operation of the AGI Samper

The AGI Universal Sampler is designed with solid adsorbents enclosed inside a tubular microporous PTFE membrane. When placed in water, the pores and hydrophobic nature of the PTFE keep liquid water from entering the membrane until a water head of about 34 feet is reached. The membrane will not keep water vapor from entering but the adsorbents are very hydrophobic and through testing validated to be unaffected by this moisture vapor. In shallow water, <34', volatile and semi-volatile compounds will partition from the dissolved water into the air phase in the PTFE membrane according to Henry's Law. This partitioning is instantaneous and within seconds-minutes, the compound is adsorbed by the adsorbent inside the sealed tube. Because the diffusivity in air is about 10,000 times higher than the diffusivity in water, the sampling rate is controlled by the water contact area of the membrane that allows the Henry's Law effect to occur. This contact area is set by the membrane diameter and length of the sealed tube, which is fixed in AGI's manufacturing process.

Henry's law as well as diffusivity, which are fundamentally incorporated into the sampling rate, are affected by temperature,  $T$ , and follow an Arrhenius equation  $H_T = H_r \times \exp\left(\frac{-E_a/R}{1/T_r - 1/T}\right)$ . Because a 5°C temperature change can make a 15% change in sampling rate, the temperature of the sampled water should be known to get the most precise concentration.

The membrane pore size is also small enough that colloidal particles and microbes cannot pass through the membrane. This keeps the adsorbent from getting contaminated and eliminates any need to add preservative or chilling during storage or transportation.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient,  $K_{AW}$ , can be approximated by the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent. The sampling rate is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

In sediment, the sampler measures pore-water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric

availability of water to the sampler is reduced by the volume fraction solids in the sediment, which typically varies from zero to 35%, but can be as high as 73% in well packed and broad particle size distribution sediments. As a result, sampling rates in sediment are multiplied by the fraction pore water in the sediment to determine concentration.

## **PART 1: Calibration in shallow water**

Part 1 summarizes the work in shallow water generating calibration data, evaluating the physical and chemical factors affecting the sampling rate, and measurement of the actual sampling rates or regression calibration equations needed to determine concentrations.

### **Sample Generation in water**

In this calibration work, solutions of analytes at known concentrations were formulated in clean 4 liter smoked glass jugs by injecting microliter measured amounts of environmental standards using a calibrated syringe into pure or deionized water and stirring for a minimum of 2 hours but generally overnight. Headspace in the jugs was minimized and generally less than 1% by volume during the tests. Jugs were temperature controlled by placing them in a water filled cooler, chilled via a copper tubing loop in the cooler. Temperature was measured with a certified digital temperature gauge and an average value used for each temperature experiment.

AGI samplers were weighted so they won't float and placed in the jugs at time zero. They were removed at various intervals to generate samples along with duplicates that showed mass increasing with exposure time. The sampler exposure time was selected to span minutes to hours and was generally reduced for high concentration tests to maintain uptake with time in roughly the linear dynamic range. Samplers were removed and dried with a paper towel and returned to their original container for analysis. They were analyzed by AGI's 8260C (SPG-WI-318 or SPG-WI-10028) method in duplicate, which is based on EPA SW846 Method 8260C.

Water samples were also taken and measured at an outside accredited lab using EPA SW846 Method 8260B. The concentrations agreed well with the calculated concentrations based on the standard certification, jug volume, and syringe injection. The variability of the outside lab 8260B values were found to be high, so for the sampling rate calculations we used the concentrations based on syringe dosing.

Calibrations were run at five concentrations, nominally at 6, 24, 118, 590, 1420 ug/L and five temperatures nominally at 5, 10, 15, 20, and 25 degrees centigrade. Samples were taken at 4 different exposure times. Samples were run in duplicate. A total of 176 data points were generated using 28 compounds from AGI's standard compounds list. Tridecane and pentadecane were not evaluated due to their very low solubility in water. In addition, another 23 compounds were tested using an 8260 liquid standard at nominal concentrations of 0.5, 1.0, 5.0, 15, 95, and 470 ug/L at a temperature typical of groundwater, 15°C. This is a living calibration and as additional data are generated, they may be qualified and added to this data set to improve the precision of the sampling rate calibration and broaden the compound list.

## Key Variable Effects

As expected from theory, at short to moderate exposure times, mass will increase roughly linearly proportional to exposure time, as well as proportional to concentration, and exponentially with temperature following Arrhenius law. Temperature affects the Henry's law as well as diffusivity in water. Sampling rate is generally independent of concentration and time at mass values significantly below saturation. In the following sections we have characterized the sampling rate for each compound as affected by temperature and also developed calibrations using regression which account for the minor impact of time, and mass.

## Concentration using Simple Sampling Rate Determination

A simple way to determine concentration is to measure mass on the AGI sampler, divide by exposure time, and divide by sampling rate, SR.

$$\text{Conc [ug/L]} = \text{mass/time/SR} \quad (1)$$

The sampling rate can be determined via measurements of mass versus time at a known concentration and temperature according to the following modification of equation (1).

$$\text{SR} = \text{mass/time/concentration} \quad (2)$$

Sampling rates in L/hr were determined by measuring the trend or regression mass uptake versus time and dividing by the concentration. A measurement like this will use 8 data points (4 times x 2 samples). Such a sampling rate can be measured at any concentration and temperature.

The chart to the right shows a plot of mass versus time for water at 118 ug/L and 287K (actual data from a single run). Slope of 0.465 ug/hr divided by the concentration of 118 ug/L yields a sampling rate, SR, of 0.0039 L/hr.

SR's typically range from about 0.004 to 0.007 L/hr at 15°C. Table A shows SR's measured for our standard compound list at 5 temperatures.

## Rigorous Concentration using Regression

A preferred method for determining concentration that will yield improved accuracy over a wide range of concentrations, exposure times, and temperatures is to use all data in a regression analysis, which allows adjustments for the minor non-linear influences of mass and time as well as the effects of temperature. This step is done by regressing equation (1) or a universal version of equation (1):

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} * \exp(-\text{Ea}/\text{R}/\text{T})] \quad (3)$$

The subtle non-linear effects of mass and time will be evident in the deviation of coefficients b and d from 1.0. This regression generates four constants b, d, SRo, and  $-\text{Ea}/\text{R}$  by regressing  $\ln(\text{conc})$  versus  $\ln(\text{mass})$ ,  $\ln(\text{time})$ ,  $1/\text{temp}$ . These four constants can be used to determine concentration via the equation:

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} \times \exp(-\text{Ea}/\text{R}(1/\text{T}))] \quad (4)$$

Where conc is in ug/L, mass is in ug, time in hours, T in degrees Kelvin.

Equation (4) can be also expressed at a reference temperature,  $\text{Tr}$ , such as 15°C by

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRr} \times \exp(-\text{Ea}/\text{R}(1/\text{Tr} - 1/\text{T}))] \quad (5)$$

This step allows sampling rates, SRr, at any reference temperature,  $\text{Tr}$ , and for any analyte to easily be compared. The values of SRr at 293.14K can be found in Table A.

When sampling times are between 0 and 4 hours, using the 4 constant equation (5) is preferred. For concentrations from about 5 to 1500 ug/L one hour exposure times generally give the lowest error, typically with average error of 6-20% and with total error range of 12%-32%. For low concentrations where sampling times are greater than 4 hours, it is preferred to use equation (1) to avoid unrealistic effects from the coefficient d or to set d to 1.0. In such a case SR in equation (1) can be substituted with  $[\text{SRr} \times \exp(-\text{Ea}/\text{R}(1/\text{Tr} - 1/\text{T}))]$  to use an SR representative of the well temperature, T.

The chart to the right is a plot of the calculated concentration from the 4 constant regression compared to the dosed concentration. Agreement is excellent for the 176 data points.

However, there does appear to be a slight high bias of 8.6% over the full range of this data, although it is well within acceptable limits of variability.

Table B shows the tabulated summary of the 4 constants regression with Rsq values and error estimates for the 4 constants for each analyte. Most regression Rsq values are 0.99 or greater for each analyte. In general,  $-E_a/R$  is about 2400 $\pm$ 400, b is about 0.9, d is about -0.75, and SR(15°C) ranges from .004 L/hr to 0.007 L/hr increasing with MW of the compound.

### Error Estimates

The error in the water concentration values will depend on both the error in mass from the analytical method as well as the error in the concentration calibration. Table C shows the error in the mass values from the 8260C low sensitivity method.

The standard error of the regression and standard errors of the constants can be found in table B. For each compound we have measured the error between the derived concentration and the actual concentration. The error tends to be lowest at our recommended exposure time of one hour as shown by the example for Toluene to the right.

Table D shows the total average error in water concentration by compound as well as the low and high error. The average ranges from about 6% to 20%, which is similar to the analytical method errors. The low and high errors range from 12% to 32% and include contribution from measurement errors in both time and temperature.

### Sorbent Saturation

As mass increases on a solid sorbent and approaches saturation, reverse diffusion can occur causing the sampling rate to drop. Eventually the mass level will reach a maximum steady state value at any concentration. A rate of mass uptake with time that deviates significantly from linear, indicates that sorbent saturation could be an issue. When using equation (1), staying in the linear range to avoid the effects of adsorbent saturation is important. We recommend keeping the total mass on the sampler below 50 ug or flagging when this is exceeded.

The 4 constant regression accounts for some of the non linearity allowing good accuracy at higher mass levels. From the experimental data we have found this safe range can be extended to 100 ug or higher as shown in the chart below. This chart compares total mass of all compounds (excluding heavy alkanes, which have solubility issues) versus time in comparison to that predicted from the 4-constant concentration equation.

### Effect of PH and Salinity

Because neither PH nor salinity is known to have a significant impact on Henry's law or diffusivity in water, we did not expect them to have a significant impact on sampling rate. To confirm this, experiments were run varying PH from 5 to 9 and NaCl content from 0 to 2%. The chart below shows no significant impact for combinations of PH and NaCl content over this range on the sampling rate of toluene in water at 21°C.

### Checked for Effects of PH & Salinity

## Impact of Aquifer Velocity

The velocity in most aquifers is quite slow, typically a meter/day or less. Occasionally water flow could be much higher such as encountered in karst aquifers, streams or rivers. Mass transfer coefficients are higher in high flow conditions, which will lead to higher sampling rates. We validated that a highly stirred system had sampling rates about 10 times higher than those that were non-stirred. We decided to evaluate the effect of aquifer velocity.

A test apparatus was built comprising a 3" PVC pipe tee filled with clean sand in each of the horizontal straight legs and screened to leave the center open. A test solution was run through this system using a variable flow pump and AGI samplers were placed into the simulated well through the vertical leg of the tee. Tests were run to examine the effect of velocity by varying the pumping rate and hence water velocity.

The chart below shows no significant effect of aquifer velocity up to a speed of about 10 meters/day. At velocities significantly above this, similar to a stirred system, sampling rates are about 10 times higher.

## Part 2: Calibration in Deep (>34') water

Part 2 describes the effect of deep water on the AGI sampler and summarizes the effects on sampling rate and concentration measurement.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in direct contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient is closely related to the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent,  $K_{AW}$ . The sampling rate for deep water is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

Measurement of the  $K_{AW}$  was done in a one liter stainless steel vessel pressurized with nitrogen to simulate water heads above 34' of water. Pressures of up to 465 psig or 200' of water head were used. The sampling rate change was the same at all pressures above 34' of water. The  $K_{AW}$  was determined as the ratio between the mass or sampling rate above 34' of head to the rate at <34' of head and is shown in the chart below.

## Part 3: Calibration in Sediment

Part 3 describes the effect of sediment solids or sediment pore volume on the sampling rate and concentration measurement.

In sediment, the sampler measures pore water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric availability of water to the sampler is reduced by the volume fraction solids in the sediment. As a result sampling rates in sediment are multiplied by the fraction pore water to determine

concentration. Pore water fraction can range from 1.0 for water without sediment to as low as 0.25. Typically most sediments have pore fractions of 0.9 to 0.65.

A sampling rate study was done with water and with water added into a well-packed sorted sand. Pore water fraction in this test was measured between 30.8% and 33% by volume. Below is a plot of the ratio of sampling rates measured in the sediment to open water. The average ratio is equal to the pore water fraction confirming that sampling rate in sediment is on average equal to the product of pore water fraction times the sampling rate in water.

## Summary

The AGI Sampler can be used to determine the concentration of volatile and semi-volatile compounds in a water phase. This requires knowing the exposure time and water temperature. It also requires knowing if the sample is above or below 34' of water head and if the water has a velocity above 10 meters/day. Regressions of large amounts of data were used to generate a four constant equation to generate concentration values in water. Potential error in the concentration values is excellent typically less than 25%.

# Laboratory Report

Site: Comal and San Marcos Rivers

Prepared for:

SWCA Environmental Consultants  
6200 UTSA Boulevard  
San Antonio, TX  
UNITED STATES

Prepared on:  
May 03, 2016

## Project Summary and Objective

Amplified Geochemical Imaging, LLC. (AGI) provided the AGI Environmental Survey used at:

### **Comal and San Marcos Rivers**

The service provided by AGI included delivery of the required quantity of AGI Universal Samplers, analysis by the method described below for the requested organic compounds, reporting of the data, and contour mapping (as needed).

This report includes results for only the samples noted under the Laboratory Sample Report section. If contour maps are part of the project deliverable, the maps will be prepared and issued under a separate report cover, upon receipt of a usable sitemap (electronic) and compound choices for contouring.

Written/submitted by:

**Dayna M Cobb**

Project Manager

**Jasmine R. Smith**

Chemist

Analytical data approved by:

**Ian McMullen**

Chemist

## Quality Assurance Statement

The AGI Laboratory, at Amplified Geochemical Imaging's facility in Newark, DE USA, operates under the guidelines of its ISO Standard 17025 DoD ELAP accreditation, and its Quality Assurance Manual, Operating Procedures, and Methods (SOP-QA-0462).

For this project, the analytical method, results, and observations reported do [ ] do not [ ✓ ] fall within the scope of AGI's ISO 17025 accreditation.

**Screening/Concentration Method**

The AGI Universal Samplers are analyzed at AGI's fixed laboratory using thermal desorption-gas chromatography/mass spectrometry (TD-GC/MS) instrumentation following modified U.S. EPA Method 8260 (SPG-WI-0292) which includes the following:

- **BFB Tuning Frequency:** A BFB tune is analyzed at the start of each analytical run and after every 30 samples.
- **Initial Calibration:** A minimum of a five point calibration curve is analyzed prior to the analysis of samples.
- **Initial Calibration Verification (ICV):** Following the calibration a second-source reference standard is analyzed to verify the accuracy of the calibration. Acceptance criteria for the ICV is +/- 30%.
- **Linearity of Target Compounds:** If the RSD of any target analyte is less than or equal to 25% then average response factor can be used for quantitation. If the RSD exceeds 25% for a target compound a regression equation can be used for quantitation.
- **Continuing Calibration Verification:** After every 10 samples, and at the end of each analytical batch, a mid-level second-source Reference Standard is analyzed. The acceptance criteria for all target analytes in the reference standards are +/- 50% of the true value.
- **Method Blank:** Analyzed prior to the analysis of field samples and every 30 samples.

**Note:** Analyte levels reported for the field-deployed AGI Universal Samplers that exceed trip and method blank levels, and/or the reporting limit, are more likely to have originated from on-site sources.

|                            |              |
|----------------------------|--------------|
| Media Sampled:             | WATER        |
| Chemist - sample analysis: | Fatima Niazi |
| Chemist - data processor:  | Fatima Niazi |
| Chemist - data review:     | Ian McMullen |

Method deviations: None.

Please note that data file names ending with R are rerun samples using the second pair of sorbers, in which the original results were not reported. Data file names ending in D are duplicate analysis results for the second set of sorbers from the same sampler, and are reported.

## Additional Report Information

- Comments
- Laboratory Sample Report
- Chain of Custody
- Installation and Retrieval Log
- Data Table(s) and Key
- Concentration Calculation Method Summary
- Total Ion Chromatograms

## Project Specific Comments

Customer requested that 774293, 774296, & 774297 not be analyzed due to sedimentation impacts.

1 - Installation start to end of retrieval, as reported. See installation and retrieval log for individual deployment and retrieval dates and times (i.e., sampler exposure time).

## General Comments

### Analytical QA/QC

Laboratory instrumentation consists of gas chromatographs equipped with mass selective detectors, coupled with automated thermal desorption units. Sample preparation involves cutting the tip off the bottom of the AGI Universal Sampler, and transferring one or more "sorbents" to a thermal desorption tube for analysis. The insertion/retrieval cord prevents soil, water and other interferences from coming in contact with the adsorbent. No further sample preparation is required. Any replicate sorbents not consumed in the initial analysis will be discarded fifteen (15) days from the date of the laboratory report.

Data are archived and stored in a secure manner as per AGI's Quality Assurance program (SOP-QA-0462).

Total petroleum hydrocarbons (TPH), gasoline-range petroleum hydrocarbons (GRPH), and/or diesel range petroleum hydrocarbons (DRPH), when reported, are calculated using the area under the peaks observed in m/z 55 and 57 selected ion chromatograms. Quantitation of the mass values was performed using the response factor for a specific alkane (present in the calibration standards). TPH values include the entire chromatogram and provide estimates for aliphatic hydrocarbon ranges of C4 to C20. GRPH and DRPH include only the relevant regions of the chromatograms and provide estimates for C4 to C10 and C10 to C20 aliphatic hydrocarbons, respectively.

Trip blanks were provided to document potential exposures that were not part of the signal of interest (e.g., impact during sampler shipment, installation and/or retrieval, and storage). The trip blanks are identically manufactured and packaged AGI Universal Samplers to those samplers deployed in the field. The trip blanks remain unopened during all phases of the project. Levels reported on the trip blanks may indicate potential impact to the samplers other than the contaminant source of interest.

Unresolved peak envelopes (UPEs) are represented as a series of compound peaks clustered together around a central gas chromatograph elution time in the total ion chromatogram. UPEs may be indicative of complex fluid mixtures. UPEs observed early in the chromatograms are considered to indicate presence of more volatile fluids, while UPEs observed later in the chromatogram may indicate the presence of less volatile fluids. Multiple UPEs may indicate the presence of multiple complex fluids.

Total ion chromatograms (TICs) are included in the Attachments. The eight-digit serial number of each sampler is incorporated in the TIC identification (e.g., 12345678.D represents AGI Universal Sampler 12345678).

## General Comments

### Soil Gas Sampling

For soil gas sampling, the AGI Environmental Survey reports mass levels migrating through the open pore spaces of the soil and diffusing through the sampler membrane for sorption by the engineered, hydrophobic adsorbents, housed within the membrane tube. During the migration of the soil gas away from the source to the AGI Universal Sampler, the vapors are subject to a variety of attenuation factors. The soil gas masses reported on the samplers compare favorably with the concentrations reported in the soil or groundwater (e.g., where soil gas levels are reported at greater levels to other sampled locations on the site, the matrix data should reveal the same pattern, and vice versa). However, due to a variety of factors, a perfect comparison between matrix data and soil gas levels can rarely be achieved.

Soil gas concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

Soil gas signals reported by this method cannot be correlated specifically to soil adsorbed, groundwater, and /or free-phase contamination. The soil gas signal reported from each AGI Universal Sampler can evolve from all of these sources. Differentiation between soil and groundwater contamination can only be achieved with prior knowledge of the site history (i.e., the site is known to have groundwater contamination only).

### Air Sampling

For indoor, outdoor, and crawlspace air sampling, the AGI Environmental Survey reports mass levels present in the air and diffusing through the sampler membrane for sorption by the engineered adsorbents housed within the membrane tube.

Air concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

### Groundwater and Sediment Porewater Sampling

For groundwater and sediment porewater sampling, the AGI Environmental Survey reports the mass levels of compounds present in the water which, when coming in contact with the sampler membrane, partitions out of solution, and diffuses through the sampler membrane for sorption by the engineered adsorbents.

Water concentrations ( $\mu\text{g}/\text{L}$ ) are calculated using the quantified mass, exposure period and the compound specific uptake rate. The rates were measured under controlled experimental conditions. The uptake rates are corrected for water pressure (depth of the AGI Universal Sampler below the water table), water temperature and the aquifer flow rate. For sediment porewater, the uptake rate is corrected for the reduced volume of water in the sediment, by multiplying the uptake rate by the pore water fraction.

## KEY TO DATA TABLE

### UNITS

|                   |  |
|-------------------|--|
| µg                | micrograms, relative mass value                              |
| µg/m <sup>3</sup> | micrograms per cubic meter; estimated soil gas concentration |
| µg/L              | micrograms per Liter; calculated water concentration         |

### DATA QUALIFIERS

|   |  |
|---|--|
| > | greater than; value exceeds calibration range, estimated value   |
| < | less than; compound value is below the LOD and RL                |
| J | mass value below LOQ or RL, but above LOD, estimated mass value  |
| E | mass value exceeds upper calibration level, estimated mass value |
| Q | one or more quality control parameters failed for the compound   |

### ABBREVIATIONS

|        |  |
|--------|--|

## SUMMARY OF SAMPLING RATE CALIBRATION FOR AGI UNIVERSAL SAMPLER IN AQUEOUS PHASES

### INTRODUCTION:

The Amplified Geochemical Imaging, LLC (AGI) passive vapor sampler is designed to be used for soil gas, water, sediment pore water, and air sampling. This document describes the process used to calibrate the sampler's compound specific sampling or uptake rates in aqueous phases.

Sampling rates are measured following AGI's "Standard Practice for Determining the Sampling Rate of Passive Diffusion Samplers in Various Environmental Media": SPG-SOP-0493. Rates are used to calculate dissolved phase concentrations of volatile and semi-volatile contaminants in water. The calibration process is summarized in three parts: Part 1: shallow water, Part 2: deep water, and Part 3: sediment.

### PURPOSE:

The purpose of this document is to:

1. Summarize the test protocol,
2. Summarize the methodology for analysis of data,
3. Present general results for generating concentration calibration of the AGI Universal Sampler

### Principle of Operation of the AGI Sampler

The AGI Universal Sampler is designed with solid adsorbents enclosed inside a tubular microporous PTFE membrane. When placed in water, the pores and hydrophobic nature of the PTFE keep liquid water from entering the membrane until a water head of about 34 feet is reached. The membrane will not keep water vapor from entering but the adsorbents are very hydrophobic and through testing validated to be unaffected by this moisture vapor. In shallow water, <34', volatile and semi-volatile compounds will partition from the dissolved water into the air phase in the PTFE membrane according to Henry's Law. This partitioning is instantaneous and within seconds-minutes, the compound is adsorbed by the adsorbent inside the sealed tube. Because the diffusivity in air is about 10,000 times higher than the diffusivity in water, the sampling rate is controlled by the water contact area of the membrane that allows the Henry's Law effect to occur. This contact area is set by the membrane diameter and length of the sealed tube, which is fixed in AGI's manufacturing process.

Henry's law as well as diffusivity, which are fundamentally incorporated into the sampling rate, are affected by temperature,  $T$ , and follow an Arrhenius equation  $H_T = H_r \times \exp\left(\frac{-E_a/R}{1/T_r - 1/T}\right)$ . Because a 5°C temperature change can make a 15% change in sampling rate, the temperature of the sampled water should be known to get the most precise concentration.

The membrane pore size is also small enough that colloidal particles and microbes cannot pass through the membrane. This keeps the adsorbent from getting contaminated and eliminates any need to add preservative or chilling during storage or transportation.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient,  $K_{AW}$ , can be approximated by the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent. The sampling rate is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

In sediment, the sampler measures pore-water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric

availability of water to the sampler is reduced by the volume fraction solids in the sediment, which typically varies from zero to 35%, but can be as high as 73% in well packed and broad particle size distribution sediments. As a result, sampling rates in sediment are multiplied by the fraction pore water in the sediment to determine concentration.

## **PART 1: Calibration in shallow water**

Part 1 summarizes the work in shallow water generating calibration data, evaluating the physical and chemical factors affecting the sampling rate, and measurement of the actual sampling rates or regression calibration equations needed to determine concentrations.

### **Sample Generation in water**

In this calibration work, solutions of analytes at known concentrations were formulated in clean 4 liter smoked glass jugs by injecting microliter measured amounts of environmental standards using a calibrated syringe into pure or deionized water and stirring for a minimum of 2 hours but generally overnight. Headspace in the jugs was minimized and generally less than 1% by volume during the tests. Jugs were temperature controlled by placing them in a water filled cooler, chilled via a copper tubing loop in the cooler. Temperature was measured with a certified digital temperature gauge and an average value used for each temperature experiment.

AGI samplers were weighted so they won't float and placed in the jugs at time zero. They were removed at various intervals to generate samples along with duplicates that showed mass increasing with exposure time. The sampler exposure time was selected to span minutes to hours and was generally reduced for high concentration tests to maintain uptake with time in roughly the linear dynamic range. Samplers were removed and dried with a paper towel and returned to their original container for analysis. They were analyzed by AGI's 8260C (SPG-WI-318 or SPG-WI-10028) method in duplicate, which is based on EPA SW846 Method 8260C.

Water samples were also taken and measured at an outside accredited lab using EPA SW846 Method 8260B. The concentrations agreed well with the calculated concentrations based on the standard certification, jug volume, and syringe injection. The variability of the outside lab 8260B values were found to be high, so for the sampling rate calculations we used the concentrations based on syringe dosing.

Calibrations were run at five concentrations, nominally at 6, 24, 118, 590, 1420 ug/L and five temperatures nominally at 5, 10, 15, 20, and 25 degrees centigrade. Samples were taken at 4 different exposure times. Samples were run in duplicate. A total of 176 data points were generated using 28 compounds from AGI's standard compounds list. Tridecane and pentadecane were not evaluated due to their very low solubility in water. In addition, another 23 compounds were tested using an 8260 liquid standard at nominal concentrations of 0.5, 1.0, 5.0, 15, 95, and 470 ug/L at a temperature typical of groundwater, 15°C. This is a living calibration and as additional data are generated, they may be qualified and added to this data set to improve the precision of the sampling rate calibration and broaden the compound list.

## Key Variable Effects

As expected from theory, at short to moderate exposure times, mass will increase roughly linearly proportional to exposure time, as well as proportional to concentration, and exponentially with temperature following Arrhenius law. Temperature affects the Henry's law as well as diffusivity in water. Sampling rate is generally independent of concentration and time at mass values significantly below saturation. In the following sections we have characterized the sampling rate for each compound as affected by temperature and also developed calibrations using regression which account for the minor impact of time, and mass.

## Concentration using Simple Sampling Rate Determination

A simple way to determine concentration is to measure mass on the AGI sampler, divide by exposure time, and divide by sampling rate, SR.

$$\text{Conc [ug/L]} = \text{mass/time/SR} \quad (1)$$

The sampling rate can be determined via measurements of mass versus time at a known concentration and temperature according to the following modification of equation (1).

$$\text{SR} = \text{mass/time/concentration} \quad (2)$$

Sampling rates in L/hr were determined by measuring the trend or regression mass uptake versus time and dividing by the concentration. A measurement like this will use 8 data points (4 times x 2 samples). Such a sampling rate can be measured at any concentration and temperature.

The chart to the right shows a plot of mass versus time for water at 118 ug/L and 287K (actual data from a single run). Slope of 0.465 ug/hr divided by the concentration of 118 ug/L yields a sampling rate, SR, of 0.0039 L/hr.

SR's typically range from about 0.004 to 0.007 L/hr at 15°C. Table A shows SR's measured for our standard compound list at 5 temperatures.

## Rigorous Concentration using Regression

A preferred method for determining concentration that will yield improved accuracy over a wide range of concentrations, exposure times, and temperatures is to use all data in a regression analysis, which allows adjustments for the minor non-linear influences of mass and time as well as the effects of temperature. This step is done by regressing equation (1) or a universal version of equation (1):

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} * \exp(-\text{Ea}/\text{R}/\text{T})] \quad (3)$$

The subtle non-linear effects of mass and time will be evident in the deviation of coefficients b and d from 1.0. This regression generates four constants b, d, SRo, and  $-\text{Ea}/\text{R}$  by regressing  $\ln(\text{conc})$  versus  $\ln(\text{mass})$ ,  $\ln(\text{time})$ ,  $1/\text{temp}$ . These four constants can be used to determine concentration via the equation:

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} * \exp(-\text{Ea}/\text{R}(1/\text{T}))] \quad (4)$$

Where conc is in ug/L, mass is in ug, time in hours, T in degrees Kelvin.

Equation (4) can be also expressed at a reference temperature,  $\text{Tr}$ , such as 15°C by

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRr} * \exp(-\text{Ea}/\text{R}(1/\text{Tr} - 1/\text{T}))] \quad (5)$$

This step allows sampling rates, SRr, at any reference temperature,  $\text{Tr}$ , and for any analyte to easily be compared. The values of SRr at 293.14K can be found in Table A.

When sampling times are between 0 and 4 hours, using the 4 constant equation (5) is preferred. For concentrations from about 5 to 1500 ug/L one hour exposure times generally give the lowest error, typically with average error of 6-20% and with total error range of 12%-32%. For low concentrations where sampling times are greater than 4 hours, it is preferred to use equation (1) to avoid unrealistic effects from the coefficient d or to set d to 1.0. In such a case SR in equation (1) can be substituted with  $[\text{SRr} * \exp(-\text{Ea}/\text{R}(1/\text{Tr} - 1/\text{T}))]$  to use an SR representative of the well temperature, T.

The chart to the right is a plot of the calculated concentration from the 4 constant regression compared to the dosed concentration. Agreement is excellent for the 176 data points.

However, there does appear to be a slight high bias of 8.6% over the full range of this data, although it is well within acceptable limits of variability.

Table B shows the tabulated summary of the 4 constants regression with Rsq values and error estimates for the 4 constants for each analyte. Most regression Rsq values are 0.99 or greater for each analyte. In general,  $-E_a/R$  is about 2400 $\pm$ 400, b is about 0.9, d is about -0.75, and SR(15°C) ranges from .004 L/hr to 0.007 L/hr increasing with MW of the compound.

### Error Estimates

The error in the water concentration values will depend on both the error in mass from the analytical method as well as the error in the concentration calibration. Table C shows the error in the mass values from the 8260C low sensitivity method.

The standard error of the regression and standard errors of the constants can be found in table B. For each compound we have measured the error between the derived concentration and the actual concentration. The error tends to be lowest at our recommended exposure time of one hour as shown by the example for Toluene to the right.

Table D shows the total average error in water concentration by compound as well as the low and high error. The average ranges from about 6% to 20%, which is similar to the analytical method errors. The low and high errors range from 12% to 32% and include contribution from measurement errors in both time and temperature.

### Sorbent Saturation

As mass increases on a solid sorbent and approaches saturation, reverse diffusion can occur causing the sampling rate to drop. Eventually the mass level will reach a maximum steady state value at any concentration. A rate of mass uptake with time that deviates significantly from linear, indicates that sorbent saturation could be an issue. When using equation (1), staying in the linear range to avoid the effects of adsorbent saturation is important. We recommend keeping the total mass on the sampler below 50 ug or flagging when this is exceeded.

The 4 constant regression accounts for some of the non linearity allowing good accuracy at higher mass levels. From the experimental data we have found this safe range can be extended to 100 ug or higher as shown in the chart below. This chart compares total mass of all compounds (excluding heavy alkanes, which have solubility issues) versus time in comparison to that predicted from the 4-constant concentration equation.

### Effect of PH and Salinity

Because neither PH nor salinity is known to have a significant impact on Henry's law or diffusivity in water, we did not expect them to have a significant impact on sampling rate. To confirm this, experiments were run varying PH from 5 to 9 and NaCl content from 0 to 2%. The chart below shows no significant impact for combinations of PH and NaCl content over this range on the sampling rate of toluene in water at 21°C.

### Checked for Effects of PH & Salinity

## Impact of Aquifer Velocity

The velocity in most aquifers is quite slow, typically a meter/day or less. Occasionally water flow could be much higher such as encountered in karst aquifers, streams or rivers. Mass transfer coefficients are higher in high flow conditions, which will lead to higher sampling rates. We validated that a highly stirred system had sampling rates about 10 times higher than those that were non-stirred. We decided to evaluate the effect of aquifer velocity.

A test apparatus was built comprising a 3" PVC pipe tee filled with clean sand in each of the horizontal straight legs and screened to leave the center open. A test solution was run through this system using a variable flow pump and AGI samplers were placed into the simulated well through the vertical leg of the tee. Tests were run to examine the effect of velocity by varying the pumping rate and hence water velocity.

The chart below shows no significant effect of aquifer velocity up to a speed of about 10 meters/day. At velocities significantly above this, similar to a stirred system, sampling rates are about 10 times higher.

## Part 2: Calibration in Deep (>34') water

Part 2 describes the effect of deep water on the AGI sampler and summarizes the effects on sampling rate and concentration measurement.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in direct contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient is closely related to the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent,  $K_{AW}$ . The sampling rate for deep water is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

Measurement of the  $K_{AW}$  was done in a one liter stainless steel vessel pressurized with nitrogen to simulate water heads above 34' of water. Pressures of up to 465 psig or 200' of water head were used. The sampling rate change was the same at all pressures above 34' of water. The  $K_{AW}$  was determined as the ratio between the mass or sampling rate above 34' of head to the rate at <34' of head and is shown in the chart below.

## Part 3: Calibration in Sediment

Part 3 describes the effect of sediment solids or sediment pore volume on the sampling rate and concentration measurement.

In sediment, the sampler measures pore water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric availability of water to the sampler is reduced by the volume fraction solids in the sediment. As a result sampling rates in sediment are multiplied by the fraction pore water to determine

concentration. Pore water fraction can range from 1.0 for water without sediment to as low as 0.25. Typically most sediments have pore fractions of 0.9 to 0.65.

A sampling rate study was done with water and with water added into a well-packed sorted sand. Pore water fraction in this test was measured between 30.8% and 33% by volume. Below is a plot of the ratio of sampling rates measured in the sediment to open water. The average ratio is equal to the pore water fraction confirming that sampling rate in sediment is on average equal to the product of pore water fraction times the sampling rate in water.

## Summary

The AGI Sampler can be used to determine the concentration of volatile and semi-volatile compounds in a water phase. This requires knowing the exposure time and water temperature. It also requires knowing if the sample is above or below 34' of water head and if the water has a velocity above 10 meters/day. Regressions of large amounts of data were used to generate a four constant equation to generate concentration values in water. Potential error in the concentration values is excellent typically less than 25%.

# Laboratory Report

Site: Comal & San Marcos Rivers June 2016

Prepared for:

SWCA Environmental Consultants  
6200 UTSA Boulevard  
Suite 102  
San Antonio, TX  
UNITED STATES

Prepared on:  
July 13, 2016

## Project Summary and Objective

Amplified Geochemical Imaging, LLC. (AGI) provided the AGI Environmental Survey used at:

**Comal & San Marcos Rivers June 2016**

The service provided by AGI included delivery of the required quantity of AGI Universal Samplers, analysis by the method described below for the requested organic compounds, reporting of the data, and contour mapping (as needed).

This report includes results for only the samples noted under the Laboratory Sample Report section. If contour maps are part of the project deliverable, the maps will be prepared and issued under a separate report cover, upon receipt of a usable sitemap (electronic) and compound choices for contouring.

Written/submitted by:

**Kelly J Stringham**

Project Manager

Reviewed/approved by:

**Dayna M Cobb**

Project Manager

Analytical data approved by:

**Fatima Niazi**

Chemist

## Quality Assurance Statement

The AGI Laboratory, at Amplified Geochemical Imaging's facility in Newark, DE USA, operates under the guidelines of its ISO Standard 17025 DoD ELAP accreditation, and its Quality Assurance Manual, Operating Procedures, and Methods (SOP-QA-0462).

For this project, the analytical method, results, and observations reported do [ ] do not [ ☒ ] fall within the scope of AGI's ISO 17025 accreditation.

**Screening/Concentration Method**

The AGI Universal Samplers are analyzed at AGI's fixed laboratory using thermal desorption-gas chromatography/mass spectrometry (TD-GC/MS) instrumentation following modified U.S. EPA Method 8260 (SPG-WI-0292) which includes the following:

- **BFB Tuning Frequency:** A BFB tune is analyzed at the start of each analytical run and after every 30 samples.
- **Initial Calibration:** A minimum of a five point calibration curve is analyzed prior to the analysis of samples.
- **Initial Calibration Verification (ICV):** Following the calibration a second-source reference standard is analyzed to verify the accuracy of the calibration. Acceptance criteria for the ICV is +/- 30%.
- **Linearity of Target Compounds:** If the RSD of any target analyte is less than or equal to 25% then average response factor can be used for quantitation. If the RSD exceeds 25% for a target compound a regression equation can be used for quantitation.
- **Continuing Calibration Verification:** After every 10 samples, and at the end of each analytical batch, a mid-level second-source Reference Standard is analyzed. The acceptance criteria for all target analytes in the reference standards are +/- 50% of the true value.
- **Method Blank:** Analyzed prior to the analysis of field samples and every 30 samples.

**Note:** Analyte levels reported for the field-deployed AGI Universal Samplers that exceed trip and method blank levels, and/or the reporting limit, are more likely to have originated from on-site sources.

|                            |               |
|----------------------------|---------------|
| Media Sampled:             | WATER         |
| Chemist - sample analysis: | Jasmine Smith |
| Chemist - data processor:  | Jasmine Smith |
| Chemist - data review:     | Fatima Niazi  |

Method deviations: None

Please note that data file names ending with R are rerun samples using the second pair of sorbers, in which the original results were not reported. Data file names ending in D are duplicate analysis results for the second set of sorbers from the same sampler, and are reported.

## Additional Report Information

- Comments
- Laboratory Sample Report
- Chain of Custody
- Installation and Retrieval Log
- Data Table(s) and Key
- Concentration Calculation Method Summary
- Total Ion Chromatograms

## Project Specific Comments

Sampler 00774455 was analyzed as a trip blank. Samplers 00774451 and 00774452 were not analyzed upon request by SWCA Environmental Consultants.

1 - Installation start to end of retrieval, as reported. See installation and retrieval log for individual deployment and retrieval dates and times (i.e., sampler exposure time).

## General Comments

### Analytical QA/QC

Laboratory instrumentation consists of gas chromatographs equipped with mass selective detectors, coupled with automated thermal desorption units. Sample preparation involves cutting the tip off the bottom of the AGI Universal Sampler, and transferring one or more "sorbents" to a thermal desorption tube for analysis. The insertion/retrieval cord prevents soil, water and other interferences from coming in contact with the adsorbent. No further sample preparation is required. Any replicate sorbents not consumed in the initial analysis will be discarded fifteen (15) days from the date of the laboratory report.

Data are archived and stored in a secure manner as per AGI's Quality Assurance program (SOP-QA-0462).

Total petroleum hydrocarbons (TPH), gasoline-range petroleum hydrocarbons (GRPH), and/or diesel range petroleum hydrocarbons (DRPH), when reported, are calculated using the area under the peaks observed in m/z 55 and 57 selected ion chromatograms. Quantitation of the mass values was performed using the response factor for a specific alkane (present in the calibration standards). TPH values include the entire chromatogram and provide estimates for aliphatic hydrocarbon ranges of C4 to C20. GRPH and DRPH include only the relevant regions of the chromatograms and provide estimates for C4 to C10 and C10 to C20 aliphatic hydrocarbons, respectively.

Trip blanks were provided to document potential exposures that were not part of the signal of interest (e.g., impact during sampler shipment, installation and/or retrieval, and storage). The trip blanks are identically manufactured and packaged AGI Universal Samplers to those samplers deployed in the field. The trip blanks remain unopened during all phases of the project. Levels reported on the trip blanks may indicate potential impact to the samplers other than the contaminant source of interest.

Unresolved peak envelopes (UPEs) are represented as a series of compound peaks clustered together around a central gas chromatograph elution time in the total ion chromatogram. UPEs may be indicative of complex fluid mixtures. UPEs observed early in the chromatograms are considered to indicate presence of more volatile fluids, while UPEs observed later in the chromatogram may indicate the presence of less volatile fluids. Multiple UPEs may indicate the presence of multiple complex fluids.

Total ion chromatograms (TICs) are included in the Attachments. The eight-digit serial number of each sampler is incorporated in the TIC identification (e.g., 12345678.D represents AGI Universal Sampler 12345678).

## General Comments

### Soil Gas Sampling

For soil gas sampling, the AGI Environmental Survey reports mass levels migrating through the open pore spaces of the soil and diffusing through the sampler membrane for sorption by the engineered, hydrophobic adsorbents, housed within the membrane tube. During the migration of the soil gas away from the source to the AGI Universal Sampler, the vapors are subject to a variety of attenuation factors. The soil gas masses reported on the samplers compare favorably with the concentrations reported in the soil or groundwater (e.g., where soil gas levels are reported at greater levels to other sampled locations on the site, the matrix data should reveal the same pattern, and vice versa). However, due to a variety of factors, a perfect comparison between matrix data and soil gas levels can rarely be achieved.

Soil gas concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

Soil gas signals reported by this method cannot be correlated specifically to soil adsorbed, groundwater, and /or free-phase contamination. The soil gas signal reported from each AGI Universal Sampler can evolve from all of these sources. Differentiation between soil and groundwater contamination can only be achieved with prior knowledge of the site history (i.e., the site is known to have groundwater contamination only).

### Air Sampling

For indoor, outdoor, and crawlspace air sampling, the AGI Environmental Survey reports mass levels present in the air and diffusing through the sampler membrane for sorption by the engineered adsorbents housed within the membrane tube.

Air concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

### Groundwater and Sediment Porewater Sampling

For groundwater and sediment porewater sampling, the AGI Environmental Survey reports the mass levels of compounds present in the water which, when coming in contact with the sampler membrane, partitions out of solution, and diffuses through the sampler membrane for sorption by the engineered adsorbents.

Water concentrations ( $\mu\text{g}/\text{L}$ ) are calculated using the quantified mass, exposure period and the compound specific uptake rate. The rates were measured under controlled experimental conditions. The uptake rates are corrected for water pressure (depth of the AGI Universal Sampler below the water table), water temperature and the aquifer flow rate. For sediment porewater, the uptake rate is corrected for the reduced volume of water in the sediment, by multiplying the uptake rate by the pore water fraction.

## SUMMARY OF SAMPLING RATE CALIBRATION FOR AGI UNIVERSAL SAMPLER IN AQUEOUS PHASES

### INTRODUCTION:

The Amplified Geochemical Imaging, LLC (AGI) passive vapor sampler is designed to be used for soil gas, water, sediment pore water, and air sampling. This document describes the process used to calibrate the sampler's compound specific sampling or uptake rates in aqueous phases.

Sampling rates are measured following AGI's "Standard Practice for Determining the Sampling Rate of Passive Diffusion Samplers in Various Environmental Media": SPG-SOP-0493. Rates are used to calculate dissolved phase concentrations of volatile and semi-volatile contaminants in water. The calibration process is summarized in three parts: Part 1: shallow water, Part 2: deep water, and Part 3: sediment.

### PURPOSE:

The purpose of this document is to:

1. Summarize the test protocol,
2. Summarize the methodology for analysis of data,
3. Present general results for generating concentration calibration of the AGI Universal Sampler

### Principle of Operation of the AGI Sampler

The AGI Universal Sampler is designed with solid adsorbents enclosed inside a tubular microporous PTFE membrane. When placed in water, the pores and hydrophobic nature of the PTFE keep liquid water from entering the membrane until a water head of about 34 feet is reached. The membrane will not keep water vapor from entering but the adsorbents are very hydrophobic and through testing validated to be unaffected by this moisture vapor. In shallow water, <34', volatile and semi-volatile compounds will partition from the dissolved water into the air phase in the PTFE membrane according to Henry's Law. This partitioning is instantaneous and within seconds-minutes, the compound is adsorbed by the adsorbent inside the sealed tube. Because the diffusivity in air is about 10,000 times higher than the diffusivity in water, the sampling rate is controlled by the water contact area of the membrane that allows the Henry's Law effect to occur. This contact area is set by the membrane diameter and length of the sealed tube, which is fixed in AGI's manufacturing process.

Henry's law as well as diffusivity, which are fundamentally incorporated into the sampling rate, are affected by temperature,  $T$ , and follow an Arrhenius equation  $H_T = H_r \times \exp\left(\frac{-E_a/R}{1/T_r - 1/T}\right)$ . Because a 5°C temperature change can make a 15% change in sampling rate, the temperature of the sampled water should be known to get the most precise concentration.

The membrane pore size is also small enough that colloidal particles and microbes cannot pass through the membrane. This keeps the adsorbent from getting contaminated and eliminates any need to add preservative or chilling during storage or transportation.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient,  $K_{AW}$ , can be approximated by the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent. The sampling rate is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

In sediment, the sampler measures pore-water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric

availability of water to the sampler is reduced by the volume fraction solids in the sediment, which typically varies from zero to 35%, but can be as high as 73% in well packed and broad particle size distribution sediments. As a result, sampling rates in sediment are multiplied by the fraction pore water in the sediment to determine concentration.

## **PART 1: Calibration in shallow water**

Part 1 summarizes the work in shallow water generating calibration data, evaluating the physical and chemical factors affecting the sampling rate, and measurement of the actual sampling rates or regression calibration equations needed to determine concentrations.

### **Sample Generation in water**

In this calibration work, solutions of analytes at known concentrations were formulated in clean 4 liter smoked glass jugs by injecting microliter measured amounts of environmental standards using a calibrated syringe into pure or deionized water and stirring for a minimum of 2 hours but generally overnight. Headspace in the jugs was minimized and generally less than 1% by volume during the tests. Jugs were temperature controlled by placing them in a water filled cooler, chilled via a copper tubing loop in the cooler. Temperature was measured with a certified digital temperature gauge and an average value used for each temperature experiment.

AGI samplers were weighted so they won't float and placed in the jugs at time zero. They were removed at various intervals to generate samples along with duplicates that showed mass increasing with exposure time. The sampler exposure time was selected to span minutes to hours and was generally reduced for high concentration tests to maintain uptake with time in roughly the linear dynamic range. Samplers were removed and dried with a paper towel and returned to their original container for analysis. They were analyzed by AGI's 8260C (SPG-WI-318 or SPG-WI-10028) method in duplicate, which is based on EPA SW846 Method 8260C.

Water samples were also taken and measured at an outside accredited lab using EPA SW846 Method 8260B. The concentrations agreed well with the calculated concentrations based on the standard certification, jug volume, and syringe injection. The variability of the outside lab 8260B values were found to be high, so for the sampling rate calculations we used the concentrations based on syringe dosing.

Calibrations were run at five concentrations, nominally at 6, 24, 118, 590, 1420 ug/L and five temperatures nominally at 5, 10, 15, 20, and 25 degrees centigrade. Samples were taken at 4 different exposure times. Samples were run in duplicate. A total of 176 data points were generated using 28 compounds from AGI's standard compounds list. Tridecane and pentadecane were not evaluated due to their very low solubility in water. In addition, another 23 compounds were tested using an 8260 liquid standard at nominal concentrations of 0.5, 1.0, 5.0, 15, 95, and 470 ug/L at a temperature typical of groundwater, 15°C. This is a living calibration and as additional data are generated, they may be qualified and added to this data set to improve the precision of the sampling rate calibration and broaden the compound list.

## Key Variable Effects

As expected from theory, at short to moderate exposure times, mass will increase roughly linearly proportional to exposure time, as well as proportional to concentration, and exponentially with temperature following Arrhenius law. Temperature affects the Henry's law as well as diffusivity in water. Sampling rate is generally independent of concentration and time at mass values significantly below saturation. In the following sections we have characterized the sampling rate for each compound as affected by temperature and also developed calibrations using regression which account for the minor impact of time, and mass.

## Concentration using Simple Sampling Rate Determination

A simple way to determine concentration is to measure mass on the AGI sampler, divide by exposure time, and divide by sampling rate, SR.

$$\text{Conc [ug/L]} = \text{mass/time/SR} \quad (1)$$

The sampling rate can be determined via measurements of mass versus time at a known concentration and temperature according to the following modification of equation (1).

$$\text{SR} = \text{mass/time/concentration} \quad (2)$$

Sampling rates in L/hr were determined by measuring the trend or regression mass uptake versus time and dividing by the concentration. A measurement like this will use 8 data points (4 times x 2 samples). Such a sampling rate can be measured at any concentration and temperature.

The chart to the right shows a plot of mass versus time for water at 118 ug/L and 287K (actual data from a single run). Slope of 0.465 ug/hr divided by the concentration of 118 ug/L yields a sampling rate, SR, of 0.0039 L/hr.

SR's typically range from about 0.004 to 0.007 L/hr at 15°C. Table A shows SR's measured for our standard compound list at 5 temperatures.

## Rigorous Concentration using Regression

A preferred method for determining concentration that will yield improved accuracy over a wide range of concentrations, exposure times, and temperatures is to use all data in a regression analysis, which allows adjustments for the minor non-linear influences of mass and time as well as the effects of temperature. This step is done by regressing equation (1) or a universal version of equation (1):

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} * \exp(-\text{Ea}/\text{R}/\text{T})] \quad (3)$$

The subtle non-linear effects of mass and time will be evident in the deviation of coefficients b and d from 1.0. This regression generates four constants b, d, SRo, and  $-\text{Ea}/\text{R}$  by regressing  $\ln(\text{conc})$  versus  $\ln(\text{mass})$ ,  $\ln(\text{time})$ ,  $1/\text{temp}$ . These four constants can be used to determine concentration via the equation:

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} \times \exp(-\text{Ea}/\text{R}(1/\text{T}))] \quad (4)$$

Where conc is in ug/L, mass is in ug, time in hours, T in degrees Kelvin.

Equation (4) can be also expressed at a reference temperature,  $\text{Tr}$ , such as 15°C by

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRr} \times \exp(-\text{Ea}/\text{R}(1/\text{Tr}-1/\text{T}))] \quad (5)$$

This step allows sampling rates, SRr, at any reference temperature,  $\text{Tr}$ , and for any analyte to easily be compared. The values of SRr at 293.14K can be found in Table A.

When sampling times are between 0 and 4 hours, using the 4 constant equation (5) is preferred. For concentrations from about 5 to 1500 ug/L one hour exposure times generally give the lowest error, typically with average error of 6-20% and with total error range of 12%-32%. For low concentrations where sampling times are greater than 4 hours, it is preferred to use equation (1) to avoid unrealistic effects from the coefficient d or to set d to 1.0. In such a case SR in equation (1) can be substituted with  $[\text{SRr} \times \exp(-\text{Ea}/\text{R}(1/\text{Tr}-1/\text{T}))]$  to use an SR representative of the well temperature, T.

The chart to the right is a plot of the calculated concentration from the 4 constant regression compared to the dosed concentration. Agreement is excellent for the 176 data points.

However, there does appear to be a slight high bias of 8.6% over the full range of this data, although it is well within acceptable limits of variability.

Table B shows the tabulated summary of the 4 constants regression with Rsq values and error estimates for the 4 constants for each analyte. Most regression Rsq values are 0.99 or greater for each analyte. In general,  $-E_a/R$  is about 2400 $\pm$ 400, b is about 0.9, d is about -0.75, and SR(15°C) ranges from .004 L/hr to 0.007 L/hr increasing with MW of the compound.

### Error Estimates

The error in the water concentration values will depend on both the error in mass from the analytical method as well as the error in the concentration calibration. Table C shows the error in the mass values from the 8260C low sensitivity method.

The standard error of the regression and standard errors of the constants can be found in table B. For each compound we have measured the error between the derived concentration and the actual concentration. The error tends to be lowest at our recommended exposure time of one hour as shown by the example for Toluene to the right.

Table D shows the total average error in water concentration by compound as well as the low and high error. The average ranges from about 6% to 20%, which is similar to the analytical method errors. The low and high errors range from 12% to 32% and include contribution from measurement errors in both time and temperature.

### Sorbent Saturation

As mass increases on a solid sorbent and approaches saturation, reverse diffusion can occur causing the sampling rate to drop. Eventually the mass level will reach a maximum steady state value at any concentration. A rate of mass uptake with time that deviates significantly from linear, indicates that sorbent saturation could be an issue. When using equation (1), staying in the linear range to avoid the effects of adsorbent saturation is important. We recommend keeping the total mass on the sampler below 50 ug or flagging when this is exceeded.

The 4 constant regression accounts for some of the non linearity allowing good accuracy at higher mass levels. From the experimental data we have found this safe range can be extended to 100 ug or higher as shown in the chart below. This chart compares total mass of all compounds (excluding heavy alkanes, which have solubility issues) versus time in comparison to that predicted from the 4-constant concentration equation.

### Effect of PH and Salinity

Because neither PH nor salinity is known to have a significant impact on Henry's law or diffusivity in water, we did not expect them to have a significant impact on sampling rate. To confirm this, experiments were run varying PH from 5 to 9 and NaCl content from 0 to 2%. The chart below shows no significant impact for combinations of PH and NaCl content over this range on the sampling rate of toluene in water at 21°C.

### Checked for Effects of PH & Salinity

## Impact of Aquifer Velocity

The velocity in most aquifers is quite slow, typically a meter/day or less. Occasionally water flow could be much higher such as encountered in karst aquifers, streams or rivers. Mass transfer coefficients are higher in high flow conditions, which will lead to higher sampling rates. We validated that a highly stirred system had sampling rates about 10 times higher than those that were non-stirred. We decided to evaluate the effect of aquifer velocity.

A test apparatus was built comprising a 3" PVC pipe tee filled with clean sand in each of the horizontal straight legs and screened to leave the center open. A test solution was run through this system using a variable flow pump and AGI samplers were placed into the simulated well through the vertical leg of the tee. Tests were run to examine the effect of velocity by varying the pumping rate and hence water velocity.

The chart below shows no significant effect of aquifer velocity up to a speed of about 10 meters/day. At velocities significantly above this, similar to a stirred system, sampling rates are about 10 times higher.

## Part 2: Calibration in Deep (>34') water

Part 2 describes the effect of deep water on the AGI sampler and summarizes the effects on sampling rate and concentration measurement.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in direct contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient is closely related to the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent,  $K_{AW}$ . The sampling rate for deep water is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

Measurement of the  $K_{AW}$  was done in a one liter stainless steel vessel pressurized with nitrogen to simulate water heads above 34' of water. Pressures of up to 465 psig or 200' of water head were used. The sampling rate change was the same at all pressures above 34' of water. The  $K_{AW}$  was determined as the ratio between the mass or sampling rate above 34' of head to the rate at <34' of head and is shown in the chart below.

## Part 3: Calibration in Sediment

Part 3 describes the effect of sediment solids or sediment pore volume on the sampling rate and concentration measurement.

In sediment, the sampler measures pore water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric availability of water to the sampler is reduced by the volume fraction solids in the sediment. As a result sampling rates in sediment are multiplied by the fraction pore water to determine

concentration. Pore water fraction can range from 1.0 for water without sediment to as low as 0.25. Typically most sediments have pore fractions of 0.9 to 0.65.

A sampling rate study was done with water and with water added into a well-packed sorted sand. Pore water fraction in this test was measured between 30.8% and 33% by volume. Below is a plot of the ratio of sampling rates measured in the sediment to open water. The average ratio is equal to the pore water fraction confirming that sampling rate in sediment is on average equal to the product of pore water fraction times the sampling rate in water.

## Summary

The AGI Sampler can be used to determine the concentration of volatile and semi-volatile compounds in a water phase. This requires knowing the exposure time and water temperature. It also requires knowing if the sample is above or below 34' of water head and if the water has a velocity above 10 meters/day. Regressions of large amounts of data were used to generate a four constant equation to generate concentration values in water. Potential error in the concentration values is excellent typically less than 25%.

# Laboratory Report

Site: Comal & San Marcos Rivers Project #27122

Prepared for:

SWCA Environmental Consultants  
6200 UTSA Boulevard  
Suite 102  
San Antonio, TX  
UNITED STATES

Prepared on:  
September 7, 2016

## Project Summary and Objective

Amplified Geochemical Imaging, LLC. (AGI) provided the AGI Environmental Survey used at:

### **Comal & San Marcos Rivers Project #27122**

The service provided by AGI included delivery of the required quantity of AGI Universal Samplers, analysis by the method described below for the requested organic compounds, reporting of the data, and contour mapping (as needed).

This report includes results for only the samples noted under the Laboratory Sample Report section. If contour maps are part of the project deliverable, the maps will be prepared and issued under a separate report cover, upon receipt of a usable sitemap (electronic) and compound choices for contouring.

## Quality Assurance Statement

The AGI Laboratory, at Amplified Geochemical Imaging's facility in Newark, DE USA, operates under the guidelines of its ISO Standard 17025 DoD ELAP accreditation, and its Quality Assurance Manual, Operating Procedures, and Methods (SOP-QA-0462).

For this project, the analytical method, results, and observations reported do [ ] do not [ ✓ ] fall within the scope of AGI's ISO 17025 accreditation.

**Screening/Concentration Method**

The AGI Universal Samplers are analyzed at AGI's fixed laboratory using thermal desorption-gas chromatography/mass spectrometry (TD-GC/MS) instrumentation following modified U.S. EPA Method 8260 (SPG-WI-0292) which includes the following:

- **BFB Tuning Frequency:** A BFB tune is analyzed at the start of each analytical run and after every 30 samples.
- **Initial Calibration:** A minimum of a five point calibration curve is analyzed prior to the analysis of samples.
- **Initial Calibration Verification (ICV):** Following the calibration a second-source reference standard is analyzed to verify the accuracy of the calibration. Acceptance criteria for the ICV is +/- 30%.
- **Linearity of Target Compounds:** If the RSD of any target analyte is less than or equal to 25% then average response factor can be used for quantitation. If the RSD exceeds 25% for a target compound a regression equation can be used for quantitation.
- **Continuing Calibration Verification:** After every 10 samples, and at the end of each analytical batch, a mid-level second-source Reference Standard is analyzed. The acceptance criteria for all target analytes in the reference standards are +/- 50% of the true value.
- **Method Blank:** Analyzed prior to the analysis of field samples and every 30 samples.

**Note:** Analyte levels reported for the field-deployed AGI Universal Samplers that exceed trip and method blank levels, and/or the reporting limit, are more likely to have originated from on-site sources.

|                            |               |
|----------------------------|---------------|
| Media Sampled:             | WATER         |
| Chemist - sample analysis: | Jasmine Smith |
| Chemist - data processor:  | Jasmine Smith |
| Chemist - data review:     | Ian McMullen  |

Method deviations: None

Please note that data file names ending with R are rerun samples using the second pair of sorbers, in which the original results were not reported. Data file names ending in D are duplicate analysis results for the second set of sorbers from the same sampler, and are reported.

## Additional Report Information

- Chain of Custody
- Installation and Retrieval Log
- Data Table(s) and Key
- Concentration Calculation Method Summary
- Total Ion Chromatograms

## Project Specific Comments

Sampler 00776701 was analyzed as a trip blank.

Survey period <sup>1</sup>

Samplers were installed on August 9, 2016 and retrieved on August 23, 2016 for an exposure period of 14 days.

Tamper seal intact:

Yes

Date received:

8/25/16 10:30 am

By: Darlene Yellowdy

COC returned:

Yes

Comments:

None

<sup>1</sup> - Installation start to end of retrieval, as reported. See installation and retrieval log for individual deployment and retrieval dates and times (i.e., sampler exposure time).

## General Comments

### Analytical QA/QC

Laboratory instrumentation consists of gas chromatographs equipped with mass selective detectors, coupled with automated thermal desorption units. Sample preparation involves cutting the tip off the bottom of the AGI Universal Sampler, and transferring one or more "sorbents" to a thermal desorption tube for analysis. The insertion/retrieval cord prevents soil, water and other interferences from coming in contact with the adsorbent. No further sample preparation is required. Any replicate sorbents not consumed in the initial analysis will be discarded fifteen (15) days from the date of the laboratory report.

Data are archived and stored in a secure manner as per AGI's Quality Assurance program (SOP-QA-0462).

Total petroleum hydrocarbons (TPH), gasoline-range petroleum hydrocarbons (GRPH), and/or diesel range petroleum hydrocarbons (DRPH), when reported, are calculated using the area under the peaks observed in m/z 55 and 57 selected ion chromatograms. Quantitation of the mass values was performed using the response factor for a specific alkane (present in the calibration standards). TPH values include the entire chromatogram and provide estimates for aliphatic hydrocarbon ranges of C4 to C20. GRPH and DRPH include only the relevant regions of the chromatograms and provide estimates for C4 to C10 and C10 to C20 aliphatic hydrocarbons, respectively.

Trip blanks were provided to document potential exposures that were not part of the signal of interest (e.g., impact during sampler shipment, installation and/or retrieval, and storage). The trip blanks are identically manufactured and packaged AGI Universal Samplers to those samplers deployed in the field. The trip blanks remain unopened during all phases of the project. Levels reported on the trip blanks may indicate potential impact to the samplers other than the contaminant source of interest.

Unresolved peak envelopes (UPEs) are represented as a series of compound peaks clustered together around a central gas chromatograph elution time in the total ion chromatogram. UPEs may be indicative of complex fluid mixtures. UPEs observed early in the chromatograms are considered to indicate presence of more volatile fluids, while UPEs observed later in the chromatogram may indicate the presence of less volatile fluids. Multiple UPEs may indicate the presence of multiple complex fluids.

Total ion chromatograms (TICs) are included in the Attachments. The eight-digit serial number of each sampler is incorporated in the TIC identification (e.g., 12345678.D represents AGI Universal Sampler 12345678).

## General Comments

### Soil Gas Sampling

For soil gas sampling, the AGI Environmental Survey reports mass levels migrating through the open pore spaces of the soil and diffusing through the sampler membrane for sorption by the engineered, hydrophobic adsorbents, housed within the membrane tube. During the migration of the soil gas away from the source to the AGI Universal Sampler, the vapors are subject to a variety of attenuation factors. The soil gas masses reported on the samplers compare favorably with the concentrations reported in the soil or groundwater (e.g., where soil gas levels are reported at greater levels to other sampled locations on the site, the matrix data should reveal the same pattern, and vice versa). However, due to a variety of factors, a perfect comparison between matrix data and soil gas levels can rarely be achieved.

Soil gas concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

Soil gas signals reported by this method cannot be correlated specifically to soil adsorbed, groundwater, and /or free-phase contamination. The soil gas signal reported from each AGI Universal Sampler can evolve from all of these sources. Differentiation between soil and groundwater contamination can only be achieved with prior knowledge of the site history (i.e., the site is known to have groundwater contamination only).

### Air Sampling

For indoor, outdoor, and crawlspace air sampling, the AGI Environmental Survey reports mass levels present in the air and diffusing through the sampler membrane for sorption by the engineered adsorbents housed within the membrane tube.

Air concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

### Groundwater and Sediment Porewater Sampling

For groundwater and sediment porewater sampling, the AGI Environmental Survey reports the mass levels of compounds present in the water which, when coming in contact with the sampler membrane, partitions out of solution, and diffuses through the sampler membrane for sorption by the engineered adsorbents.

Water concentrations ( $\mu\text{g}/\text{L}$ ) are calculated using the quantified mass, exposure period and the compound specific uptake rate. The rates were measured under controlled experimental conditions. The uptake rates are corrected for water pressure (depth of the AGI Universal Sampler below the water table), water temperature and the aquifer flow rate. For sediment porewater, the uptake rate is corrected for the reduced volume of water in the sediment, by multiplying the uptake rate by the pore water fraction.

Prepared By: [Signature]

Verified By: Marlene Galloway

Installation Method: (Circle those that apply)

Slide Hammer Hammer Drill Auger

Other Enclosed in deployment device in river

Installation Performed By:

Name: JENNIFER MORELAND

Company: SWCA

Retrieval Performed By:

Name: Philip Pearce

Company: SWCA

Installation Start Date / Time: 8/9/16 / 10:29 AM

Installation Complete Date / Time: 8/9/16 / 13:54

Retrieval Start Date / Time: 8/23/16 10:39

Retrieval Complete Date / Time: 8/23/16 14:37

Total Samplers Retrieved: 14 + 1 TRIP BLANK

Total Samplers Lost In Field: 0

Total Unused Samplers Returned: 1

Insertion Rod Sections Returned: NA

## KEY TO DATA TABLE

### UNITS

|                   |  |
|-------------------|--|
| µg                | micrograms, relative mass value                              |
| µg/m <sup>3</sup> | micrograms per cubic meter; estimated soil gas concentration |
| µg/L              | micrograms per Liter; calculated water concentration         |

### DATA QUALIFIERS

|   |  |
|---|--|
| > | greater than; value exceeds calibration range, estimated value   |
| < | less than; compound value is below the LOD and RL                |
| J | mass value below LOQ or RL, but above LOD, estimated mass value  |
| E | mass value exceeds upper calibration level, estimated mass value |
| Q | one or more quality control parameters failed for the compound   |

### ABBREVIATIONS

|        |  |
|--------|--|
| AVG RL | average reporting limit; calculated based on individual field sample RLs |
| LOD    | limit of detection   |
| LOQ    | limit of quantification  |

## SUMMARY OF SAMPLING RATE CALIBRATION FOR AGI UNIVERSAL SAMPLER IN AQUEOUS PHASES

### INTRODUCTION:

The Amplified Geochemical Imaging, LLC (AGI) passive vapor sampler is designed to be used for soil gas, water, sediment pore water, and air sampling. This document describes the process used to calibrate the sampler's compound specific sampling or uptake rates in aqueous phases.

Sampling rates are measured following AGI's "Standard Practice for Determining the Sampling Rate of Passive Diffusion Samplers in Various Environmental Media": SPG-SOP-0493. Rates are used to calculate dissolved phase concentrations of volatile and semi-volatile contaminants in water. The calibration process is summarized in three parts: Part 1: shallow water, Part 2: deep water, and Part 3: sediment.

### PURPOSE:

The purpose of this document is to:

1. Summarize the test protocol,
2. Summarize the methodology for analysis of data,
3. Present general results for generating concentration calibration of the AGI Universal Sampler

### Principle of Operation of the AGI Sampler

The AGI Universal Sampler is designed with solid adsorbents enclosed inside a tubular microporous PTFE membrane. When placed in water, the pores and hydrophobic nature of the PTFE keep liquid water from entering the membrane until a water head of about 34 feet is reached. The membrane will not keep water vapor from entering but the adsorbents are very hydrophobic and through testing validated to be unaffected by this moisture vapor. In shallow water, <34', volatile and semi-volatile compounds will partition from the dissolved water into the air phase in the PTFE membrane according to Henry's Law. This partitioning is instantaneous and within seconds-minutes, the compound is adsorbed by the adsorbent inside the sealed tube. Because the diffusivity in air is about 10,000 times higher than the diffusivity in water, the sampling rate is controlled by the water contact area of the membrane that allows the Henry's Law effect to occur. This contact area is set by the membrane diameter and length of the sealed tube, which is fixed in AGI's manufacturing process.

Henry's law as well as diffusivity, which are fundamentally incorporated into the sampling rate, are affected by temperature,  $T$ , and follow an Arrhenius equation  $H_T = H_r \times \exp\left(\frac{-E_a/R}{1/T_r - 1/T}\right)$ . Because a 5°C temperature change can make a 15% change in sampling rate, the temperature of the sampled water should be known to get the most precise concentration.

The membrane pore size is also small enough that colloidal particles and microbes cannot pass through the membrane. This keeps the adsorbent from getting contaminated and eliminates any need to add preservative or chilling during storage or transportation.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient,  $K_{AW}$ , can be approximated by the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent. The sampling rate is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

In sediment, the sampler measures pore-water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric

availability of water to the sampler is reduced by the volume fraction solids in the sediment, which typically varies from zero to 35%, but can be as high as 73% in well packed and broad particle size distribution sediments. As a result, sampling rates in sediment are multiplied by the fraction pore water in the sediment to determine concentration.

## **PART 1: Calibration in shallow water**

Part 1 summarizes the work in shallow water generating calibration data, evaluating the physical and chemical factors affecting the sampling rate, and measurement of the actual sampling rates or regression calibration equations needed to determine concentrations.

### **Sample Generation in water**

In this calibration work, solutions of analytes at known concentrations were formulated in clean 4 liter smoked glass jugs by injecting microliter measured amounts of environmental standards using a calibrated syringe into pure or deionized water and stirring for a minimum of 2 hours but generally overnight. Headspace in the jugs was minimized and generally less than 1% by volume during the tests. Jugs were temperature controlled by placing them in a water filled cooler, chilled via a copper tubing loop in the cooler. Temperature was measured with a certified digital temperature gauge and an average value used for each temperature experiment.

AGI samplers were weighted so they won't float and placed in the jugs at time zero. They were removed at various intervals to generate samples along with duplicates that showed mass increasing with exposure time. The sampler exposure time was selected to span minutes to hours and was generally reduced for high concentration tests to maintain uptake with time in roughly the linear dynamic range. Samplers were removed and dried with a paper towel and returned to their original container for analysis. They were analyzed by AGI's 8260C (SPG-WI-318 or SPG-WI-10028) method in duplicate, which is based on EPA SW846 Method 8260C.

Water samples were also taken and measured at an outside accredited lab using EPA SW846 Method 8260B. The concentrations agreed well with the calculated concentrations based on the standard certification, jug volume, and syringe injection. The variability of the outside lab 8260B values were found to be high, so for the sampling rate calculations we used the concentrations based on syringe dosing.

Calibrations were run at five concentrations, nominally at 6, 24, 118, 590, 1420 ug/L and five temperatures nominally at 5, 10, 15, 20, and 25 degrees centigrade. Samples were taken at 4 different exposure times. Samples were run in duplicate. A total of 176 data points were generated using 28 compounds from AGI's standard compounds list. Tridecane and pentadecane were not evaluated due to their very low solubility in water. In addition, another 23 compounds were tested using an 8260 liquid standard at nominal concentrations of 0.5, 1.0, 5.0, 15, 95, and 470 ug/L at a temperature typical of groundwater, 15°C. This is a living calibration and as additional data are generated, they may be qualified and added to this data set to improve the precision of the sampling rate calibration and broaden the compound list.

## Key Variable Effects

As expected from theory, at short to moderate exposure times, mass will increase roughly linearly proportional to exposure time, as well as proportional to concentration, and exponentially with temperature following Arrhenius law. Temperature affects the Henry's law as well as diffusivity in water. Sampling rate is generally independent of concentration and time at mass values significantly below saturation. In the following sections we have characterized the sampling rate for each compound as affected by temperature and also developed calibrations using regression which account for the minor impact of time, and mass.

## Concentration using Simple Sampling Rate Determination

A simple way to determine concentration is to measure mass on the AGI sampler, divide by exposure time, and divide by sampling rate, SR.

$$\text{Conc [ug/L]} = \text{mass/time/SR} \quad (1)$$

The sampling rate can be determined via measurements of mass versus time at a known concentration and temperature according to the following modification of equation (1).

$$\text{SR} = \text{mass/time/concentration} \quad (2)$$

Sampling rates in L/hr were determined by measuring the trend or regression mass uptake versus time and dividing by the concentration. A measurement like this will use 8 data points (4 times x 2 samples). Such a sampling rate can be measured at any concentration and temperature.

The chart to the right shows a plot of mass versus time for water at 118 ug/L and 287K (actual data from a single run). Slope of 0.465 ug/hr divided by the concentration of 118 ug/L yields a sampling rate, SR, of 0.0039 L/hr.

SR's typically range from about 0.004 to 0.007 L/hr at 15°C. Table A shows SR's measured for our standard compound list at 5 temperatures.

## Rigorous Concentration using Regression

A preferred method for determining concentration that will yield improved accuracy over a wide range of concentrations, exposure times, and temperatures is to use all data in a regression analysis, which allows adjustments for the minor non-linear influences of mass and time as well as the effects of temperature. This step is done by regressing equation (1) or a universal version of equation (1):

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} * \exp(-\text{Ea}/\text{R}/\text{T})] \quad (3)$$

The subtle non-linear effects of mass and time will be evident in the deviation of coefficients b and d from 1.0. This regression generates four constants b, d, SRo, and  $-\text{Ea}/\text{R}$  by regressing  $\ln(\text{conc})$  versus  $\ln(\text{mass})$ ,  $\ln(\text{time})$ ,  $1/\text{temp}$ . These four constants can be used to determine concentration via the equation:

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} * \exp(-\text{Ea}/\text{R}(1/\text{T}))] \quad (4)$$

Where conc is in ug/L, mass is in ug, time in hours, T in degrees Kelvin.

Equation (4) can be also expressed at a reference temperature,  $\text{Tr}$ , such as 15°C by

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRr} * \exp(-\text{Ea}/\text{R}(1/\text{Tr} - 1/\text{T}))] \quad (5)$$

This step allows sampling rates, SRr, at any reference temperature,  $\text{Tr}$ , and for any analyte to easily be compared. The values of SRr at 293.14K can be found in Table A.

When sampling times are between 0 and 4 hours, using the 4 constant equation (5) is preferred. For concentrations from about 5 to 1500 ug/L one hour exposure times generally give the lowest error, typically with average error of 6-20% and with total error range of 12%-32%. For low concentrations where sampling times are greater than 4 hours, it is preferred to use equation (1) to avoid unrealistic effects from the coefficient d or to set d to 1.0. In such a case SR in equation (1) can be substituted with  $[\text{SRr} * \exp(-\text{Ea}/\text{R}(1/\text{Tr} - 1/\text{T}))]$  to use an SR representative of the well temperature, T.

The chart to the right is a plot of the calculated concentration from the 4 constant regression compared to the dosed concentration. Agreement is excellent for the 176 data points.

However, there does appear to be a slight high bias of 8.6% over the full range of this data, although it is well within acceptable limits of variability.

Table B shows the tabulated summary of the 4 constants regression with Rsq values and error estimates for the 4 constants for each analyte. Most regression Rsq values are 0.99 or greater for each analyte. In general,  $-E_a/R$  is about 2400 $\pm$ 400, b is about 0.9, d is about -0.75, and SR(15°C) ranges from .004 L/hr to 0.007 L/hr increasing with MW of the compound.

### Error Estimates

The error in the water concentration values will depend on both the error in mass from the analytical method as well as the error in the concentration calibration. Table C shows the error in the mass values from the 8260C low sensitivity method.

The standard error of the regression and standard errors of the constants can be found in table B. For each compound we have measured the error between the derived concentration and the actual concentration. The error tends to be lowest at our recommended exposure time of one hour as shown by the example for Toluene to the right.

Table D shows the total average error in water concentration by compound as well as the low and high error. The average ranges from about 6% to 20%, which is similar to the analytical method errors. The low and high errors range from 12% to 32% and include contribution from measurement errors in both time and temperature.

### Sorbent Saturation

As mass increases on a solid sorbent and approaches saturation, reverse diffusion can occur causing the sampling rate to drop. Eventually the mass level will reach a maximum steady state value at any concentration. A rate of mass uptake with time that deviates significantly from linear, indicates that sorbent saturation could be an issue. When using equation (1), staying in the linear range to avoid the effects of adsorbent saturation is important. We recommend keeping the total mass on the sampler below 50 ug or flagging when this is exceeded.

The 4 constant regression accounts for some of the non linearity allowing good accuracy at higher mass levels. From the experimental data we have found this safe range can be extended to 100 ug or higher as shown in the chart below. This chart compares total mass of all compounds (excluding heavy alkanes, which have solubility issues) versus time in comparison to that predicted from the 4-constant concentration equation.

### Effect of PH and Salinity

Because neither PH nor salinity is known to have a significant impact on Henry's law or diffusivity in water, we did not expect them to have a significant impact on sampling rate. To confirm this, experiments were run varying PH from 5 to 9 and NaCl content from 0 to 2%. The chart below shows no significant impact for combinations of PH and NaCl content over this range on the sampling rate of toluene in water at 21°C.

### Checked for Effects of PH & Salinity

## Impact of Aquifer Velocity

The velocity in most aquifers is quite slow, typically a meter/day or less. Occasionally water flow could be much higher such as encountered in karst aquifers, streams or rivers. Mass transfer coefficients are higher in high flow conditions, which will lead to higher sampling rates. We validated that a highly stirred system had sampling rates about 10 times higher than those that were non-stirred. We decided to evaluate the effect of aquifer velocity.

A test apparatus was built comprising a 3" PVC pipe tee filled with clean sand in each of the horizontal straight legs and screened to leave the center open. A test solution was run through this system using a variable flow pump and AGI samplers were placed into the simulated well through the vertical leg of the tee. Tests were run to examine the effect of velocity by varying the pumping rate and hence water velocity.

The chart below shows no significant effect of aquifer velocity up to a speed of about 10 meters/day. At velocities significantly above this, similar to a stirred system, sampling rates are about 10 times higher.

## Part 2: Calibration in Deep (>34') water

Part 2 describes the effect of deep water on the AGI sampler and summarizes the effects on sampling rate and concentration measurement.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in direct contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient is closely related to the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent,  $K_{AW}$ . The sampling rate for deep water is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

Measurement of the  $K_{AW}$  was done in a one liter stainless steel vessel pressurized with nitrogen to simulate water heads above 34' of water. Pressures of up to 465 psig or 200' of water head were used. The sampling rate change was the same at all pressures above 34' of water. The  $K_{AW}$  was determined as the ratio between the mass or sampling rate above 34' of head to the rate at <34' of head and is shown in the chart below.

## Part 3: Calibration in Sediment

Part 3 describes the effect of sediment solids or sediment pore volume on the sampling rate and concentration measurement.

In sediment, the sampler measures pore water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric availability of water to the sampler is reduced by the volume fraction solids in the sediment. As a result sampling rates in sediment are multiplied by the fraction pore water to determine

concentration. Pore water fraction can range from 1.0 for water without sediment to as low as 0.25. Typically most sediments have pore fractions of 0.9 to 0.65.

A sampling rate study was done with water and with water added into a well-packed sorted sand. Pore water fraction in this test was measured between 30.8% and 33% by volume. Below is a plot of the ratio of sampling rates measured in the sediment to open water. The average ratio is equal to the pore water fraction confirming that sampling rate in sediment is on average equal to the product of pore water fraction times the sampling rate in water.

## Summary

The AGI Sampler can be used to determine the concentration of volatile and semi-volatile compounds in a water phase. This requires knowing the exposure time and water temperature. It also requires knowing if the sample is above or below 34' of water head and if the water has a velocity above 10 meters/day. Regressions of large amounts of data were used to generate a four constant equation to generate concentration values in water. Potential error in the concentration values is excellent typically less than 25%.

# Laboratory Report

Site: Comal & San Marcos Rivers October 2016

Prepared for:

SWCA Environmental Consultants  
6200 UTSA Boulevard  
Suite 102  
San Antonio, TX  
UNITED STATES

Prepared on:  
November 4, 2016

## Project Summary and Objective

Amplified Geochemical Imaging, LLC. (AGI) provided the AGI Environmental Survey used at:

**Comal & San Marcos Rivers October 2016**

The service provided by AGI included delivery of the required quantity of AGI Universal Samplers, analysis by the method described below for the requested organic compounds, reporting of the data, and contour mapping (as needed).

This report includes results for only the samples noted under the Laboratory Sample Report section. If contour maps are part of the project deliverable, the maps will be prepared and issued under a separate report cover, upon receipt of a usable sitemap (electronic) and compound choices for contouring.

Chemist

## Quality Assurance Statement

The AGI Laboratory, at Amplified Geochemical Imaging's facility in Newark, DE USA, operates under the guidelines of its ISO Standard 17025 DoD ELAP accreditation, and its Quality Assurance Manual, Operating Procedures, and Methods (SOP-QA-0462).

For this project, the analytical method, results, and observations reported do [ ] do not [ ☒ ] fall within the scope of AGI's ISO 17025 accreditation.

**Screening/Concentration Method**

The AGI Universal Samplers are analyzed at AGI's fixed laboratory using thermal desorption-gas chromatography/mass spectrometry (TD-GC/MS) instrumentation following modified U.S. EPA Method 8260 (SPG-WI-0292) which includes the following:

- **BFB Tuning Frequency:** A BFB tune is analyzed at the start of each analytical run and after every 30 samples.
- **Initial Calibration:** A minimum of a five point calibration curve is analyzed prior to the analysis of samples.
- **Initial Calibration Verification (ICV):** Following the calibration a second-source reference standard is analyzed to verify the accuracy of the calibration. Acceptance criteria for the ICV is +/- 30%.
- **Linearity of Target Compounds:** If the RSD of any target analyte is less than or equal to 25% then average response factor can be used for quantitation. If the RSD exceeds 25% for a target compound a regression equation can be used for quantitation.
- **Continuing Calibration Verification:** After every 10 samples, and at the end of each analytical batch, a mid-level second-source Reference Standard is analyzed. The acceptance criteria for all target analytes in the reference standards are +/- 50% of the true value.
- **Method Blank:** Analyzed prior to the analysis of field samples and every 30 samples.

**Note:** Analyte levels reported for the field-deployed AGI Universal Samplers that exceed trip and method blank levels, and/or the reporting limit, are more likely to have originated from on-site sources.

|                            |               |
|----------------------------|---------------|
| Media Sampled:             | WATER         |
| Chemist - sample analysis: | Jasmine Smith |
| Chemist - data processor:  | Jasmine Smith |
| Chemist - data review:     | Ian McMullen  |

Method deviations: A four point calibration curve was used for acenaphthylene to maintain linearity.

Please note that data file names ending with R are rerun samples using the second pair of sorbers, in which the original results were not reported. Data file names ending in D are duplicate analysis results for the second set of sorbers from the same sampler, and are reported.

## Additional Report Information

- Laboratory Sample Report
- Chain of Custody
- Installation and Retrieval Log
- Data Table(s) and Key
- Concentration Calculation Method Summary
- Total Ion Chromatograms

## Project Specific Comments

Samplers 00778802 and 00778803 were analyzed as trip blanks. Sampler 00778801 was returned but was not analyzed at the request of SWCA Environmental Consultants, who noted that it had been tampered with in the field.

1 - Installation start to end of retrieval, as reported. See installation and retrieval log for individual deployment and retrieval dates and times (i.e., sampler exposure time).

## General Comments

### Analytical QA/QC

Laboratory instrumentation consists of gas chromatographs equipped with mass selective detectors, coupled with automated thermal desorption units. Sample preparation involves cutting the tip off the bottom of the AGI Universal Sampler, and transferring one or more "sorbents" to a thermal desorption tube for analysis. The insertion/retrieval cord prevents soil, water and other interferences from coming in contact with the adsorbent. No further sample preparation is required. Any replicate sorbents not consumed in the initial analysis will be discarded fifteen (15) days from the date of the laboratory report.

Data are archived and stored in a secure manner as per AGI's Quality Assurance program (SOP-QA-0462).

Total petroleum hydrocarbons (TPH), gasoline-range petroleum hydrocarbons (GRPH), and/or diesel range petroleum hydrocarbons (DRPH), when reported, are calculated using the area under the peaks observed in m/z 55 and 57 selected ion chromatograms. Quantitation of the mass values was performed using the response factor for a specific alkane (present in the calibration standards). TPH values include the entire chromatogram and provide estimates for aliphatic hydrocarbon ranges of C4 to C20. GRPH and DRPH include only the relevant regions of the chromatograms and provide estimates for C4 to C10 and C10 to C20 aliphatic hydrocarbons, respectively.

Trip blanks were provided to document potential exposures that were not part of the signal of interest (e.g., impact during sampler shipment, installation and/or retrieval, and storage). The trip blanks are identically manufactured and packaged AGI Universal Samplers to those samplers deployed in the field. The trip blanks remain unopened during all phases of the project. Levels reported on the trip blanks may indicate potential impact to the samplers other than the contaminant source of interest.

Unresolved peak envelopes (UPEs) are represented as a series of compound peaks clustered together around a central gas chromatograph elution time in the total ion chromatogram. UPEs may be indicative of complex fluid mixtures. UPEs observed early in the chromatograms are considered to indicate presence of more volatile fluids, while UPEs observed later in the chromatogram may indicate the presence of less volatile fluids. Multiple UPEs may indicate the presence of multiple complex fluids.

Total ion chromatograms (TICs) are included in the Attachments. The eight-digit serial number of each sampler is incorporated in the TIC identification (e.g., 12345678.D represents AGI Universal Sampler 12345678).

## General Comments

### Soil Gas Sampling

For soil gas sampling, the AGI Environmental Survey reports mass levels migrating through the open pore spaces of the soil and diffusing through the sampler membrane for sorption by the engineered, hydrophobic adsorbents, housed within the membrane tube. During the migration of the soil gas away from the source to the AGI Universal Sampler, the vapors are subject to a variety of attenuation factors. The soil gas masses reported on the samplers compare favorably with the concentrations reported in the soil or groundwater (e.g., where soil gas levels are reported at greater levels to other sampled locations on the site, the matrix data should reveal the same pattern, and vice versa). However, due to a variety of factors, a perfect comparison between matrix data and soil gas levels can rarely be achieved.

Soil gas concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

Soil gas signals reported by this method cannot be correlated specifically to soil adsorbed, groundwater, and /or free-phase contamination. The soil gas signal reported from each AGI Universal Sampler can evolve from all of these sources. Differentiation between soil and groundwater contamination can only be achieved with prior knowledge of the site history (i.e., the site is known to have groundwater contamination only).

### Air Sampling

For indoor, outdoor, and crawlspace air sampling, the AGI Environmental Survey reports mass levels present in the air and diffusing through the sampler membrane for sorption by the engineered adsorbents housed within the membrane tube.

Air concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

### Groundwater and Sediment Porewater Sampling

For groundwater and sediment porewater sampling, the AGI Environmental Survey reports the mass levels of compounds present in the water which, when coming in contact with the sampler membrane, partitions out of solution, and diffuses through the sampler membrane for sorption by the engineered adsorbents.

Water concentrations ( $\mu\text{g}/\text{L}$ ) are calculated using the quantified mass, exposure period and the compound specific uptake rate. The rates were measured under controlled experimental conditions. The uptake rates are corrected for water pressure (depth of the AGI Universal Sampler below the water table), water temperature and the aquifer flow rate. For sediment porewater, the uptake rate is corrected for the reduced volume of water in the sediment, by multiplying the uptake rate by the pore water fraction.

## Laboratory Sample Report

## SUMMARY OF SAMPLING RATE CALIBRATION FOR AGI UNIVERSAL SAMPLER IN AQUEOUS PHASES

### INTRODUCTION:

The Amplified Geochemical Imaging, LLC (AGI) passive vapor sampler is designed to be used for soil gas, water, sediment pore water, and air sampling. This document describes the process used to calibrate the sampler's compound specific sampling or uptake rates in aqueous phases.

Sampling rates are measured following AGI's "Standard Practice for Determining the Sampling Rate of Passive Diffusion Samplers in Various Environmental Media": SPG-SOP-0493. Rates are used to calculate dissolved phase concentrations of volatile and semi-volatile contaminants in water. The calibration process is summarized in three parts: Part 1: shallow water, Part 2: deep water, and Part 3: sediment.

### PURPOSE:

The purpose of this document is to:

1. Summarize the test protocol,
2. Summarize the methodology for analysis of data,
3. Present general results for generating concentration calibration of the AGI Universal Sampler

### Principle of Operation of the AGI Sampler

The AGI Universal Sampler is designed with solid adsorbents enclosed inside a tubular microporous PTFE membrane. When placed in water, the pores and hydrophobic nature of the PTFE keep liquid water from entering the membrane until a water head of about 34 feet is reached. The membrane will not keep water vapor from entering but the adsorbents are very hydrophobic and through testing validated to be unaffected by this moisture vapor. In shallow water, <34', volatile and semi-volatile compounds will partition from the dissolved water into the air phase in the PTFE membrane according to Henry's Law. This partitioning is instantaneous and within seconds-minutes, the compound is adsorbed by the adsorbent inside the sealed tube. Because the diffusivity in air is about 10,000 times higher than the diffusivity in water, the sampling rate is controlled by the water contact area of the membrane that allows the Henry's Law effect to occur. This contact area is set by the membrane diameter and length of the sealed tube, which is fixed in AGI's manufacturing process.

Henry's law as well as diffusivity, which are fundamentally incorporated into the sampling rate, are affected by temperature,  $T$ , and follow an Arrhenius equation  $H_T = H_r \times \exp\left(\frac{-E_a/R}{1/T_r - 1/T}\right)$ . Because a 5°C temperature change can make a 15% change in sampling rate, the temperature of the sampled water should be known to get the most precise concentration.

The membrane pore size is also small enough that colloidal particles and microbes cannot pass through the membrane. This keeps the adsorbent from getting contaminated and eliminates any need to add preservative or chilling during storage or transportation.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient,  $K_{AW}$ , can be approximated by the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent. The sampling rate is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

In sediment, the sampler measures pore-water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric

availability of water to the sampler is reduced by the volume fraction solids in the sediment, which typically varies from zero to 35%, but can be as high as 73% in well packed and broad particle size distribution sediments. As a result, sampling rates in sediment are multiplied by the fraction pore water in the sediment to determine concentration.

## **PART 1: Calibration in shallow water**

Part 1 summarizes the work in shallow water generating calibration data, evaluating the physical and chemical factors affecting the sampling rate, and measurement of the actual sampling rates or regression calibration equations needed to determine concentrations.

### **Sample Generation in water**

In this calibration work, solutions of analytes at known concentrations were formulated in clean 4 liter smoked glass jugs by injecting microliter measured amounts of environmental standards using a calibrated syringe into pure or deionized water and stirring for a minimum of 2 hours but generally overnight. Headspace in the jugs was minimized and generally less than 1% by volume during the tests. Jugs were temperature controlled by placing them in a water filled cooler, chilled via a copper tubing loop in the cooler. Temperature was measured with a certified digital temperature gauge and an average value used for each temperature experiment.

AGI samplers were weighted so they won't float and placed in the jugs at time zero. They were removed at various intervals to generate samples along with duplicates that showed mass increasing with exposure time. The sampler exposure time was selected to span minutes to hours and was generally reduced for high concentration tests to maintain uptake with time in roughly the linear dynamic range. Samplers were removed and dried with a paper towel and returned to their original container for analysis. They were analyzed by AGI's 8260C (SPG-WI-318 or SPG-WI-10028) method in duplicate, which is based on EPA SW846 Method 8260C.

Water samples were also taken and measured at an outside accredited lab using EPA SW846 Method 8260B. The concentrations agreed well with the calculated concentrations based on the standard certification, jug volume, and syringe injection. The variability of the outside lab 8260B values were found to be high, so for the sampling rate calculations we used the concentrations based on syringe dosing.

Calibrations were run at five concentrations, nominally at 6, 24, 118, 590, 1420 ug/L and five temperatures nominally at 5, 10, 15, 20, and 25 degrees centigrade. Samples were taken at 4 different exposure times. Samples were run in duplicate. A total of 176 data points were generated using 28 compounds from AGI's standard compounds list. Tridecane and pentadecane were not evaluated due to their very low solubility in water. In addition, another 23 compounds were tested using an 8260 liquid standard at nominal concentrations of 0.5, 1.0, 5.0, 15, 95, and 470 ug/L at a temperature typical of groundwater, 15°C. This is a living calibration and as additional data are generated, they may be qualified and added to this data set to improve the precision of the sampling rate calibration and broaden the compound list.

## Key Variable Effects

As expected from theory, at short to moderate exposure times, mass will increase roughly linearly proportional to exposure time, as well as proportional to concentration, and exponentially with temperature following Arrhenius law. Temperature affects the Henry's law as well as diffusivity in water. Sampling rate is generally independent of concentration and time at mass values significantly below saturation. In the following sections we have characterized the sampling rate for each compound as affected by temperature and also developed calibrations using regression which account for the minor impact of time, and mass.

## Concentration using Simple Sampling Rate Determination

A simple way to determine concentration is to measure mass on the AGI sampler, divide by exposure time, and divide by sampling rate, SR.

$$\text{Conc [ug/L]} = \text{mass/time/SR} \quad (1)$$

The sampling rate can be determined via measurements of mass versus time at a known concentration and temperature according to the following modification of equation (1).

$$\text{SR} = \text{mass/time/concentration} \quad (2)$$

Sampling rates in L/hr were determined by measuring the trend or regression mass uptake versus time and dividing by the concentration. A measurement like this will use 8 data points (4 times x 2 samples). Such a sampling rate can be measured at any concentration and temperature.

The chart to the right shows a plot of mass versus time for water at 118 ug/L and 287K (actual data from a single run). Slope of 0.465 ug/hr divided by the concentration of 118 ug/L yields a sampling rate, SR, of 0.0039 L/hr.

SR's typically range from about 0.004 to 0.007 L/hr at 15°C. Table A shows SR's measured for our standard compound list at 5 temperatures.

## Rigorous Concentration using Regression

A preferred method for determining concentration that will yield improved accuracy over a wide range of concentrations, exposure times, and temperatures is to use all data in a regression analysis, which allows adjustments for the minor non-linear influences of mass and time as well as the effects of temperature. This step is done by regressing equation (1) or a universal version of equation (1):

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} * \exp(-\text{Ea}/\text{R}/\text{T})] \quad (3)$$

The subtle non-linear effects of mass and time will be evident in the deviation of coefficients b and d from 1.0. This regression generates four constants b, d, SRo, and  $-\text{Ea}/\text{R}$  by regressing  $\ln(\text{conc})$  versus  $\ln(\text{mass})$ ,  $\ln(\text{time})$ ,  $1/\text{temp}$ . These four constants can be used to determine concentration via the equation:

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} * \exp(-\text{Ea}/\text{R}(1/\text{T}))] \quad (4)$$

Where conc is in ug/L, mass is in ug, time in hours, T in degrees Kelvin.

Equation (4) can be also expressed at a reference temperature,  $\text{Tr}$ , such as 15°C by

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRr} * \exp(-\text{Ea}/\text{R}(1/\text{Tr}-1/\text{T}))] \quad (5)$$

This step allows sampling rates, SRr, at any reference temperature,  $\text{Tr}$ , and for any analyte to easily be compared. The values of SRr at 293.14K can be found in Table A.

When sampling times are between 0 and 4 hours, using the 4 constant equation (5) is preferred. For concentrations from about 5 to 1500 ug/L one hour exposure times generally give the lowest error, typically with average error of 6-20% and with total error range of 12%-32%. For low concentrations where sampling times are greater than 4 hours, it is preferred to use equation (1) to avoid unrealistic effects from the coefficient d or to set d to 1.0. In such a case SR in equation (1) can be substituted with  $[\text{SRr} * \exp(-\text{Ea}/\text{R}(1/\text{Tr}-1/\text{T}))]$  to use an SR representative of the well temperature, T.

The chart to the right is a plot of the calculated concentration from the 4 constant regression compared to the dosed concentration. Agreement is excellent for the 176 data points.

However, there does appear to be a slight high bias of 8.6% over the full range of this data, although it is well within acceptable limits of variability.

Table B shows the tabulated summary of the 4 constants regression with Rsq values and error estimates for the 4 constants for each analyte. Most regression Rsq values are 0.99 or greater for each analyte. In general,  $-E_a/R$  is about 2400 $\pm$ 400, b is about 0.9, d is about -0.75, and SR(15°C) ranges from .004 L/hr to 0.007 L/hr increasing with MW of the compound.

### Error Estimates

The error in the water concentration values will depend on both the error in mass from the analytical method as well as the error in the concentration calibration. Table C shows the error in the mass values from the 8260C low sensitivity method.

The standard error of the regression and standard errors of the constants can be found in table B. For each compound we have measured the error between the derived concentration and the actual concentration. The error tends to be lowest at our recommended exposure time of one hour as shown by the example for Toluene to the right.

Table D shows the total average error in water concentration by compound as well as the low and high error. The average ranges from about 6% to 20%, which is similar to the analytical method errors. The low and high errors range from 12% to 32% and include contribution from measurement errors in both time and temperature.

### Sorbent Saturation

As mass increases on a solid sorbent and approaches saturation, reverse diffusion can occur causing the sampling rate to drop. Eventually the mass level will reach a maximum steady state value at any concentration. A rate of mass uptake with time that deviates significantly from linear, indicates that sorbent saturation could be an issue. When using equation (1), staying in the linear range to avoid the effects of adsorbent saturation is important. We recommend keeping the total mass on the sampler below 50 ug or flagging when this is exceeded.

The 4 constant regression accounts for some of the non linearity allowing good accuracy at higher mass levels. From the experimental data we have found this safe range can be extended to 100 ug or higher as shown in the chart below. This chart compares total mass of all compounds (excluding heavy alkanes, which have solubility issues) versus time in comparison to that predicted from the 4-constant concentration equation.

### Effect of PH and Salinity

Because neither PH nor salinity is known to have a significant impact on Henry's law or diffusivity in water, we did not expect them to have a significant impact on sampling rate. To confirm this, experiments were run varying PH from 5 to 9 and NaCl content from 0 to 2%. The chart below shows no significant impact for combinations of PH and NaCl content over this range on the sampling rate of toluene in water at 21°C.

### Checked for Effects of PH & Salinity

## Impact of Aquifer Velocity

The velocity in most aquifers is quite slow, typically a meter/day or less. Occasionally water flow could be much higher such as encountered in karst aquifers, streams or rivers. Mass transfer coefficients are higher in high flow conditions, which will lead to higher sampling rates. We validated that a highly stirred system had sampling rates about 10 times higher than those that were non-stirred. We decided to evaluate the effect of aquifer velocity.

A test apparatus was built comprising a 3" PVC pipe tee filled with clean sand in each of the horizontal straight legs and screened to leave the center open. A test solution was run through this system using a variable flow pump and AGI samplers were placed into the simulated well through the vertical leg of the tee. Tests were run to examine the effect of velocity by varying the pumping rate and hence water velocity.

The chart below shows no significant effect of aquifer velocity up to a speed of about 10 meters/day. At velocities significantly above this, similar to a stirred system, sampling rates are about 10 times higher.

## Part 2: Calibration in Deep (>34') water

Part 2 describes the effect of deep water on the AGI sampler and summarizes the effects on sampling rate and concentration measurement.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in direct contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient is closely related to the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent,  $K_{AW}$ . The sampling rate for deep water is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

Measurement of the  $K_{AW}$  was done in a one liter stainless steel vessel pressurized with nitrogen to simulate water heads above 34' of water. Pressures of up to 465 psig or 200' of water head were used. The sampling rate change was the same at all pressures above 34' of water. The  $K_{AW}$  was determined as the ratio between the mass or sampling rate above 34' of head to the rate at <34' of head and is shown in the chart below.

## Part 3: Calibration in Sediment

Part 3 describes the effect of sediment solids or sediment pore volume on the sampling rate and concentration measurement.

In sediment, the sampler measures pore water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric availability of water to the sampler is reduced by the volume fraction solids in the sediment. As a result sampling rates in sediment are multiplied by the fraction pore water to determine

concentration. Pore water fraction can range from 1.0 for water without sediment to as low as 0.25. Typically most sediments have pore fractions of 0.9 to 0.65.

A sampling rate study was done with water and with water added into a well-packed sorted sand. Pore water fraction in this test was measured between 30.8% and 33% by volume. Below is a plot of the ratio of sampling rates measured in the sediment to open water. The average ratio is equal to the pore water fraction confirming that sampling rate in sediment is on average equal to the product of pore water fraction times the sampling rate in water.

## Summary

The AGI Sampler can be used to determine the concentration of volatile and semi-volatile compounds in a water phase. This requires knowing the exposure time and water temperature. It also requires knowing if the sample is above or below 34' of water head and if the water has a velocity above 10 meters/day. Regressions of large amounts of data were used to generate a four constant equation to generate concentration values in water. Potential error in the concentration values is excellent typically less than 25%.

# Laboratory Report

Site: Comal & San Marcos Rivers December 2016

Prepared for:

SWCA Environmental Consultants  
6200 UTSA Boulevard  
Suite 102  
San Antonio, TX  
UNITED STATES

Prepared on:  
December 21, 2016

## Project Summary and Objective

Amplified Geochemical Imaging, LLC. (AGI) provided the AGI Environmental Survey used at:

**Comal & San Marcos Rivers December 2016**

The service provided by AGI included delivery of the required quantity of AGI Universal Samplers, analysis by the method described below for the requested organic compounds, reporting of the data, and contour mapping (as needed).

This report includes results for only the samples noted under the Laboratory Sample Report section. If contour maps are part of the project deliverable, the maps will be prepared and issued under a separate report cover, upon receipt of a usable sitemap (electronic) and compound choices for contouring.

## Quality Assurance Statement

The AGI Laboratory, at Amplified Geochemical Imaging's facility in Newark, DE USA, operates under the guidelines of its ISO Standard 17025 DoD ELAP accreditation, and its Quality Assurance Manual, Operating Procedures, and Methods (SOP-QA-0462).

For this project, the analytical method, results, and observations reported do [ ] do not [ ✓ ] fall within the scope of AGI's ISO 17025 accreditation.

**Screening/Concentration Method**

The AGI Universal Samplers are analyzed at AGI's fixed laboratory using thermal desorption-gas chromatography/mass spectrometry (TD-GC/MS) instrumentation following modified U.S. EPA Method 8260 (SPG-WI-0292) which includes the following:

- **BFB Tuning Frequency:** A BFB tune is analyzed at the start of each analytical run and after every 30 samples.
- **Initial Calibration:** A minimum of a five point calibration curve is analyzed prior to the analysis of samples.
- **Initial Calibration Verification (ICV):** Following the calibration a second-source reference standard is analyzed to verify the accuracy of the calibration. Acceptance criteria for the ICV is +/- 30%.
- **Linearity of Target Compounds:** If the RSD of any target analyte is less than or equal to 25% then average response factor can be used for quantitation. If the RSD exceeds 25% for a target compound a regression equation can be used for quantitation.
- **Continuing Calibration Verification:** After every 10 samples, and at the end of each analytical batch, a mid-level second-source Reference Standard is analyzed. The acceptance criteria for all target analytes in the reference standards are +/- 50% of the true value.
- **Method Blank:** Analyzed prior to the analysis of field samples and every 30 samples.

**Note:** Analyte levels reported for the field-deployed AGI Universal Samplers that exceed trip and method blank levels, and/or the reporting limit, are more likely to have originated from on-site sources.

|                            |               |
|----------------------------|---------------|
| Media Sampled:             | WATER         |
| Chemist - sample analysis: | Jasmine Smith |
| Chemist - data processor:  | Jasmine Smith |
| Chemist - data review:     | Fatima Niazi  |

Method deviations: A four point calibration curve was used for toluene to maintain linearity.

Please note that data file names ending with R are rerun samples using the second pair of sorbers, in which the original results were not reported. Data file names ending in D are duplicate analysis results for the second set of sorbers from the same sampler, and are reported.

## Additional Report Information

- Comments
- Laboratory Sample Report
- Chain of Custody
- Installation and Retrieval Log
- Data Table(s) and Key
- Concentration Calculation Method Summary
- Total Ion Chromatograms

## Project Specific Comments

Samplers 00778958 and 00778959 were analyzed as trip blanks. Samplers 00778952 and 00778953 were returned but were not analyzed at the request of SWCA Environmental Consultants. Sample 00778954 was analyzed in duplicate at the request of SWCA Environmental Consultants.

1 - Installation start to end of retrieval, as reported. See installation and retrieval log for individual deployment and retrieval dates and times (i.e., sampler exposure time).

## General Comments

### Analytical QA/QC

Laboratory instrumentation consists of gas chromatographs equipped with mass selective detectors, coupled with automated thermal desorption units. Sample preparation involves cutting the tip off the bottom of the AGI Universal Sampler, and transferring one or more "sorbents" to a thermal desorption tube for analysis. The insertion/retrieval cord prevents soil, water and other interferences from coming in contact with the adsorbent. No further sample preparation is required. Any replicate sorbents not consumed in the initial analysis will be discarded fifteen (15) days from the date of the laboratory report.

Data are archived and stored in a secure manner as per AGI's Quality Assurance program (SOP-QA-0462).

Total petroleum hydrocarbons (TPH), gasoline-range petroleum hydrocarbons (GRPH), and/or diesel range petroleum hydrocarbons (DRPH), when reported, are calculated using the area under the peaks observed in m/z 55 and 57 selected ion chromatograms. Quantitation of the mass values was performed using the response factor for a specific alkane (present in the calibration standards). TPH values include the entire chromatogram and provide estimates for aliphatic hydrocarbon ranges of C4 to C20. GRPH and DRPH include only the relevant regions of the chromatograms and provide estimates for C4 to C10 and C10 to C20 aliphatic hydrocarbons, respectively.

Trip blanks were provided to document potential exposures that were not part of the signal of interest (e.g., impact during sampler shipment, installation and/or retrieval, and storage). The trip blanks are identically manufactured and packaged AGI Universal Samplers to those samplers deployed in the field. The trip blanks remain unopened during all phases of the project. Levels reported on the trip blanks may indicate potential impact to the samplers other than the contaminant source of interest.

Unresolved peak envelopes (UPEs) are represented as a series of compound peaks clustered together around a central gas chromatograph elution time in the total ion chromatogram. UPEs may be indicative of complex fluid mixtures. UPEs observed early in the chromatograms are considered to indicate presence of more volatile fluids, while UPEs observed later in the chromatogram may indicate the presence of less volatile fluids. Multiple UPEs may indicate the presence of multiple complex fluids.

Total ion chromatograms (TICs) are included in the Attachments. The eight-digit serial number of each sampler is incorporated in the TIC identification (e.g., 12345678.D represents AGI Universal Sampler 12345678).

## General Comments

### Soil Gas Sampling

For soil gas sampling, the AGI Environmental Survey reports mass levels migrating through the open pore spaces of the soil and diffusing through the sampler membrane for sorption by the engineered, hydrophobic adsorbents, housed within the membrane tube. During the migration of the soil gas away from the source to the AGI Universal Sampler, the vapors are subject to a variety of attenuation factors. The soil gas masses reported on the samplers compare favorably with the concentrations reported in the soil or groundwater (e.g., where soil gas levels are reported at greater levels to other sampled locations on the site, the matrix data should reveal the same pattern, and vice versa). However, due to a variety of factors, a perfect comparison between matrix data and soil gas levels can rarely be achieved.

Soil gas concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

Soil gas signals reported by this method cannot be correlated specifically to soil adsorbed, groundwater, and /or free-phase contamination. The soil gas signal reported from each AGI Universal Sampler can evolve from all of these sources. Differentiation between soil and groundwater contamination can only be achieved with prior knowledge of the site history (i.e., the site is known to have groundwater contamination only).

### Air Sampling

For indoor, outdoor, and crawlspace air sampling, the AGI Environmental Survey reports mass levels present in the air and diffusing through the sampler membrane for sorption by the engineered adsorbents housed within the membrane tube.

Air concentrations ( $\mu\text{g}/\text{m}^3$ ) are calculated following the method described in the Additional Report Information section.

### Groundwater and Sediment Porewater Sampling

For groundwater and sediment porewater sampling, the AGI Environmental Survey reports the mass levels of compounds present in the water which, when coming in contact with the sampler membrane, partitions out of solution, and diffuses through the sampler membrane for sorption by the engineered adsorbents.

Water concentrations ( $\mu\text{g}/\text{L}$ ) are calculated using the quantified mass, exposure period and the compound specific uptake rate. The rates were measured under controlled experimental conditions. The uptake rates are corrected for water pressure (depth of the AGI Universal Sampler below the water table), water temperature and the aquifer flow rate. For sediment porewater, the uptake rate is corrected for the reduced volume of water in the sediment, by multiplying the uptake rate by the pore water fraction.

## KEY TO DATA TABLE

### UNITS

|                   |  |
|-------------------|--|
| µg                | micrograms, relative mass value                              |
| µg/m <sup>3</sup> | micrograms per cubic meter; estimated soil gas concentration |
| µg/L              | micrograms per Liter; calculated water concentration         |

### DATA QUALIFIERS

|   |  |
|---|--|
| > | greater than; value exceeds calibration range, estimated value   |
| < | less than; compound value is below the LOD and RL                |
| J | mass value below LOQ or RL, but above LOD, estimated mass value  |
| E | mass value exceeds upper calibration level, estimated mass value |
| Q | one or more quality control parameters failed for the compound   |

### ABBREVIATIONS

|        |  |

## SUMMARY OF SAMPLING RATE CALIBRATION FOR AGI UNIVERSAL SAMPLER IN AQUEOUS PHASES

### INTRODUCTION:

The Amplified Geochemical Imaging, LLC (AGI) passive vapor sampler is designed to be used for soil gas, water, sediment pore water, and air sampling. This document describes the process used to calibrate the sampler's compound specific sampling or uptake rates in aqueous phases.

Sampling rates are measured following AGI's "Standard Practice for Determining the Sampling Rate of Passive Diffusion Samplers in Various Environmental Media": SPG-SOP-0493. Rates are used to calculate dissolved phase concentrations of volatile and semi-volatile contaminants in water. The calibration process is summarized in three parts: Part 1: shallow water, Part 2: deep water, and Part 3: sediment.

### PURPOSE:

The purpose of this document is to:

1. Summarize the test protocol,
2. Summarize the methodology for analysis of data,
3. Present general results for generating concentration calibration of the AGI Universal Sampler

### Principle of Operation of the AGI Samper

The AGI Universal Sampler is designed with solid adsorbents enclosed inside a tubular microporous PTFE membrane. When placed in water, the pores and hydrophobic nature of the PTFE keep liquid water from entering the membrane until a water head of about 34 feet is reached. The membrane will not keep water vapor from entering but the adsorbents are very hydrophobic and through testing validated to be unaffected by this moisture vapor. In shallow water, <34', volatile and semi-volatile compounds will partition from the dissolved water into the air phase in the PTFE membrane according to Henry's Law. This partitioning is instantaneous and within seconds-minutes, the compound is adsorbed by the adsorbent inside the sealed tube. Because the diffusivity in air is about 10,000 times higher than the diffusivity in water, the sampling rate is controlled by the water contact area of the membrane that allows the Henry's Law effect to occur. This contact area is set by the membrane diameter and length of the sealed tube, which is fixed in AGI's manufacturing process.

Henry's law as well as diffusivity, which are fundamentally incorporated into the sampling rate, are affected by temperature,  $T$ , and follow an Arrhenius equation  $H_T = H_r \times \exp\left(\frac{-E_a/R}{1/T_r - 1/T}\right)$ . Because a 5°C temperature change can make a 15% change in sampling rate, the temperature of the sampled water should be known to get the most precise concentration.

The membrane pore size is also small enough that colloidal particles and microbes cannot pass through the membrane. This keeps the adsorbent from getting contaminated and eliminates any need to add preservative or chilling during storage or transportation.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient,  $K_{AW}$ , can be approximated by the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent. The sampling rate is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

In sediment, the sampler measures pore-water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric

availability of water to the sampler is reduced by the volume fraction solids in the sediment, which typically varies from zero to 35%, but can be as high as 73% in well packed and broad particle size distribution sediments. As a result, sampling rates in sediment are multiplied by the fraction pore water in the sediment to determine concentration.

## **PART 1: Calibration in shallow water**

Part 1 summarizes the work in shallow water generating calibration data, evaluating the physical and chemical factors affecting the sampling rate, and measurement of the actual sampling rates or regression calibration equations needed to determine concentrations.

### **Sample Generation in water**

In this calibration work, solutions of analytes at known concentrations were formulated in clean 4 liter smoked glass jugs by injecting microliter measured amounts of environmental standards using a calibrated syringe into pure or deionized water and stirring for a minimum of 2 hours but generally overnight. Headspace in the jugs was minimized and generally less than 1% by volume during the tests. Jugs were temperature controlled by placing them in a water filled cooler, chilled via a copper tubing loop in the cooler. Temperature was measured with a certified digital temperature gauge and an average value used for each temperature experiment.

AGI samplers were weighted so they won't float and placed in the jugs at time zero. They were removed at various intervals to generate samples along with duplicates that showed mass increasing with exposure time. The sampler exposure time was selected to span minutes to hours and was generally reduced for high concentration tests to maintain uptake with time in roughly the linear dynamic range. Samplers were removed and dried with a paper towel and returned to their original container for analysis. They were analyzed by AGI's 8260C (SPG-WI-318 or SPG-WI-10028) method in duplicate, which is based on EPA SW846 Method 8260C.

Water samples were also taken and measured at an outside accredited lab using EPA SW846 Method 8260B. The concentrations agreed well with the calculated concentrations based on the standard certification, jug volume, and syringe injection. The variability of the outside lab 8260B values were found to be high, so for the sampling rate calculations we used the concentrations based on syringe dosing.

Calibrations were run at five concentrations, nominally at 6, 24, 118, 590, 1420 ug/L and five temperatures nominally at 5, 10, 15, 20, and 25 degrees centigrade. Samples were taken at 4 different exposure times. Samples were run in duplicate. A total of 176 data points were generated using 28 compounds from AGI's standard compounds list. Tridecane and pentadecane were not evaluated due to their very low solubility in water. In addition, another 23 compounds were tested using an 8260 liquid standard at nominal concentrations of 0.5, 1.0, 5.0, 15, 95, and 470 ug/L at a temperature typical of groundwater, 15°C. This is a living calibration and as additional data are generated, they may be qualified and added to this data set to improve the precision of the sampling rate calibration and broaden the compound list.

## Key Variable Effects

As expected from theory, at short to moderate exposure times, mass will increase roughly linearly proportional to exposure time, as well as proportional to concentration, and exponentially with temperature following Arrhenius law. Temperature affects the Henry's law as well as diffusivity in water. Sampling rate is generally independent of concentration and time at mass values significantly below saturation. In the following sections we have characterized the sampling rate for each compound as affected by temperature and also developed calibrations using regression which account for the minor impact of time, and mass.

## Concentration using Simple Sampling Rate Determination

A simple way to determine concentration is to measure mass on the AGI sampler, divide by exposure time, and divide by sampling rate, SR.

$$\text{Conc [ug/L]} = \text{mass/time/SR} \quad (1)$$

The sampling rate can be determined via measurements of mass versus time at a known concentration and temperature according to the following modification of equation (1).

$$\text{SR} = \text{mass/time/concentration} \quad (2)$$

Sampling rates in L/hr were determined by measuring the trend or regression mass uptake versus time and dividing by the concentration. A measurement like this will use 8 data points (4 times x 2 samples). Such a sampling rate can be measured at any concentration and temperature.

The chart to the right shows a plot of mass versus time for water at 118 ug/L and 287K (actual data from a single run). Slope of 0.465 ug/hr divided by the concentration of 118 ug/L yields a sampling rate, SR, of 0.0039 L/hr.

SR's typically range from about 0.004 to 0.007 L/hr at 15°C. Table A shows SR's measured for our standard compound list at 5 temperatures.

## Rigorous Concentration using Regression

A preferred method for determining concentration that will yield improved accuracy over a wide range of concentrations, exposure times, and temperatures is to use all data in a regression analysis, which allows adjustments for the minor non-linear influences of mass and time as well as the effects of temperature. This step is done by regressing equation (1) or a universal version of equation (1):

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} * \exp(-\text{Ea}/\text{R}/\text{T})] \quad (3)$$

The subtle non-linear effects of mass and time will be evident in the deviation of coefficients b and d from 1.0. This regression generates four constants b, d, SRo, and  $-\text{Ea}/\text{R}$  by regressing  $\ln(\text{conc})$  versus  $\ln(\text{mass})$ ,  $\ln(\text{time})$ ,  $1/\text{temp}$ . These four constants can be used to determine concentration via the equation:

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRo} * \exp(-\text{Ea}/\text{R}(1/\text{T}))] \quad (4)$$

Where conc is in ug/L, mass is in ug, time in hours, T in degrees Kelvin.

Equation (4) can be also expressed at a reference temperature,  $\text{Tr}$ , such as 15°C by

$$\text{Conc} = (\text{mass})^b / (\text{time})^{-d} / [-\text{SRr} * \exp(-\text{Ea}/\text{R}(1/\text{Tr} - 1/\text{T}))] \quad (5)$$

This step allows sampling rates, SRr, at any reference temperature,  $\text{Tr}$ , and for any analyte to easily be compared. The values of SRr at 293.14K can be found in Table A.

When sampling times are between 0 and 4 hours, using the 4 constant equation (5) is preferred. For concentrations from about 5 to 1500 ug/L one hour exposure times generally give the lowest error, typically with average error of 6-20% and with total error range of 12%-32%. For low concentrations where sampling times are greater than 4 hours, it is preferred to use equation (1) to avoid unrealistic effects from the coefficient d or to set d to 1.0. In such a case SR in equation (1) can be substituted with  $[\text{SRr} * \exp(-\text{Ea}/\text{R}(1/\text{Tr} - 1/\text{T}))]$  to use an SR representative of the well temperature, T.

The chart to the right is a plot of the calculated concentration from the 4 constant regression compared to the dosed concentration. Agreement is excellent for the 176 data points.

However, there does appear to be a slight high bias of 8.6% over the full range of this data, although it is well within acceptable limits of variability.

Table B shows the tabulated summary of the 4 constants regression with Rsq values and error estimates for the 4 constants for each analyte. Most regression Rsq values are 0.99 or greater for each analyte. In general,  $-E_a/R$  is about 2400 $\pm$ 400, b is about 0.9, d is about -0.75, and SR(15°C) ranges from .004 L/hr to 0.007 L/hr increasing with MW of the compound.

### Error Estimates

The error in the water concentration values will depend on both the error in mass from the analytical method as well as the error in the concentration calibration. Table C shows the error in the mass values from the 8260C low sensitivity method.

The standard error of the regression and standard errors of the constants can be found in table B. For each compound we have measured the error between the derived concentration and the actual concentration. The error tends to be lowest at our recommended exposure time of one hour as shown by the example for Toluene to the right.

Table D shows the total average error in water concentration by compound as well as the low and high error. The average ranges from about 6% to 20%, which is similar to the analytical method errors. The low and high errors range from 12% to 32% and include contribution from measurement errors in both time and temperature.

### Sorbent Saturation

As mass increases on a solid sorbent and approaches saturation, reverse diffusion can occur causing the sampling rate to drop. Eventually the mass level will reach a maximum steady state value at any concentration. A rate of mass uptake with time that deviates significantly from linear, indicates that sorbent saturation could be an issue. When using equation (1), staying in the linear range to avoid the effects of adsorbent saturation is important. We recommend keeping the total mass on the sampler below 50 ug or flagging when this is exceeded.

The 4 constant regression accounts for some of the non linearity allowing good accuracy at higher mass levels. From the experimental data we have found this safe range can be extended to 100 ug or higher as shown in the chart below. This chart compares total mass of all compounds (excluding heavy alkanes, which have solubility issues) versus time in comparison to that predicted from the 4-constant concentration equation.

### Effect of PH and Salinity

Because neither PH nor salinity is known to have a significant impact on Henry's law or diffusivity in water, we did not expect them to have a significant impact on sampling rate. To confirm this, experiments were run varying PH from 5 to 9 and NaCl content from 0 to 2%. The chart below shows no significant impact for combinations of PH and NaCl content over this range on the sampling rate of toluene in water at 21°C.

### Checked for Effects of PH & Salinity

## Impact of Aquifer Velocity

The velocity in most aquifers is quite slow, typically a meter/day or less. Occasionally water flow could be much higher such as encountered in karst aquifers, streams or rivers. Mass transfer coefficients are higher in high flow conditions, which will lead to higher sampling rates. We validated that a highly stirred system had sampling rates about 10 times higher than those that were non-stirred. We decided to evaluate the effect of aquifer velocity.

A test apparatus was built comprising a 3" PVC pipe tee filled with clean sand in each of the horizontal straight legs and screened to leave the center open. A test solution was run through this system using a variable flow pump and AGI samplers were placed into the simulated well through the vertical leg of the tee. Tests were run to examine the effect of velocity by varying the pumping rate and hence water velocity.

The chart below shows no significant effect of aquifer velocity up to a speed of about 10 meters/day. At velocities significantly above this, similar to a stirred system, sampling rates are about 10 times higher.

## Part 2: Calibration in Deep (>34') water

Part 2 describes the effect of deep water on the AGI sampler and summarizes the effects on sampling rate and concentration measurement.

When the water pressure exceeds the water entry pressure of the membrane, about 34 feet of water, the water becomes in direct contact with the solid adsorbent. Under this condition the compounds in the water will partition from the water into the solid. The partitioning coefficient is closely related to the octanol-water coefficient,  $K_{OW}$ , but has been measured more precisely in the lab for AGI's specific solid adsorbent,  $K_{AW}$ . The sampling rate for deep water is the product of the sampling rate at <34' of water and the  $K_{AW}$ .

Measurement of the  $K_{AW}$  was done in a one liter stainless steel vessel pressurized with nitrogen to simulate water heads above 34' of water. Pressures of up to 465 psig or 200' of water head were used. The sampling rate change was the same at all pressures above 34' of water. The  $K_{AW}$  was determined as the ratio between the mass or sampling rate above 34' of head to the rate at <34' of head and is shown in the chart below.

## Part 3: Calibration in Sediment

Part 3 describes the effect of sediment solids or sediment pore volume on the sampling rate and concentration measurement.

In sediment, the sampler measures pore water concentration, which is generally agreed to be the preferred measurement as it is more indicative of bioavailability. In sediment the volumetric availability of water to the sampler is reduced by the volume fraction solids in the sediment. As a result sampling rates in sediment are multiplied by the fraction pore water to determine

concentration. Pore water fraction can range from 1.0 for water without sediment to as low as 0.25. Typically most sediments have pore fractions of 0.9 to 0.65.

A sampling rate study was done with water and with water added into a well-packed sorted sand. Pore water fraction in this test was measured between 30.8% and 33% by volume. Below is a plot of the ratio of sampling rates measured in the sediment to open water. The average ratio is equal to the pore water fraction confirming that sampling rate in sediment is on average equal to the product of pore water fraction times the sampling rate in water.

## Summary

The AGI Sampler can be used to determine the concentration of volatile and semi-volatile compounds in a water phase. This requires knowing the exposure time and water temperature. It also requires knowing if the sample is above or below 34' of water head and if the water has a velocity above 10 meters/day. Regressions of large amounts of data were used to generate a four constant equation to generate concentration values in water. Potential error in the concentration values is excellent typically less than 25%.

## **APPENDIX H**

### **ANALYTICAL DATA VALIDATION DISCUSSION**

---

*This page intentionally left blank.*

## Introduction

This appendix provides an overview of SWCA Environmental Consultants' (SWCA's) post-analyses review of the contract laboratories analytical data set. In general, the data are considered valid for the intended purpose of assessing the baseline of sediment quality, stormwater runoff quality, surface water (base flow), and passive diffusion samplers (PDSs) at a screening level for Comal and San Marcos Springs. Analyses with any associated laboratory issues are listed herein.

Worth noting in this assessment are the detection of plasticizer compounds such as bis(2-ethylhexyl) phthalate (DEHP) and other phthalate compounds. While it is possible these compounds were introduced post-sample collection from either sampling equipment or laboratory equipment, they should not be completely dismissed.

Based on analysis of 2013 laboratory data, the Edwards Aquifer Authority (EAA) concluded that three compounds detected in sediment samples may have been laboratory artifacts. The compounds were DEHP, di-n-octyl phthalate, and di-n-butyl phthalate. The EAA noted in the 2013 *Edwards Aquifer Habitat Conservation Plan Expanded Water Quality Report* that as the data set grows, additional conclusions could be drawn. The 2014 laboratory analyses of sediment samples did not detect di-n-octyl phthalate or di-n-butyl phthalate. However, DEHP was detected in three of the sediment samples in 2014 (HSM320, HSM330, and HSM350). DEHP was also detected in three of the 2015 sediment samples (HSM330, HSM340, and HSM350). In the 2015 annual report, SWCA concluded that continued detections of DEHP indicated that DEHP may be present in the middle reaches of the San Marcos Springs complex. In 2016, DEHP was again detected in many of the sediment samples (all samples except HSM310) from both the Comal and San Marcos Spring complexes. DEHP was also detected in multiple base flow and stormwater samples collected in September and November from both spring complexes. EAA might consider further evaluating the potential presence of DEHP in sediment and surface water by splitting samples between multiple laboratories and including DEHP analysis in the planned fish tissue sampling program.

Analytical results are discussed by analytical laboratory sample data group number, and by sample event type and date. Each event (surface water/base flow, stormwater, PDS, or sediment) is discussed by sample data group with sample names and date outlined for each event in the beginning of the discussion.

A key to sample names is provided below:

### Key to Sample Names

#### H CS 1 10

**H**=HCP

**CS**=Comal Springs (**SM**=San Marcos Springs)

**1**=Sample Type (1=Surface Water (Base Flow), 2=Storm, 3=Sediment, 4=PDS)

**10**=Sample Location

Field Duplicates are identified with the prefix "FD" followed by the sample identification described above. Trip Blank samples are denoted with the prefix "TB" followed by a sequential number. Equipment Blank samples are denoted with the prefix "EB" followed by a sequential number.

## **Analytical Data Review Summary for HCP Samples Collected in 2016**

### **Data Group Numbers (HCP surface water/base flow samples collected March 2, 2016, and March 3, 2016, Comal and San Marcos springs):**

|                                    |                                    |
|------------------------------------|------------------------------------|
| <i>560-60073-1</i> (HCS 110)       | <i>560-60099-1</i> (HSM 110)       |
| <i>560-60073-2</i> (HCS 120)       | <i>560-60099-2</i> (FDHSM 110)     |
| <i>560-60073-3</i> (FDHCS 120)     | <i>560-60099-3</i> (HSM 120)       |
| <i>560-60073-4</i> (HCS 130)       | <i>560-60099-4</i> (HSM 130)       |

|                                    | <i>560-60099-8</i> (HSM170)        |
|                                    | <i>560-60099-9</i> (Trip Blank 03) |

### **General Comments**

Although some analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation. pH values are collected in the field at the time of sample collection and are listed in the field parameters for each sample event. As such, the laboratory pH values that are flagged for hold time exceedances are not used for sample assessment purposes.

### **Trip Blanks**

There were no detections in the trip blanks associated with this sample set.

### **Quality Assurance/Quality Control (QA/QC) Discussion – Comal and San Marcos Springs Surface/Base Flow Samples (Sampled March 2, 2016, and March 3, 2016)**

#### **Issues associated with work order 560-60073**

Method 8260B – The matrix spike/matrix spike duplicate (MS/MSD) recoveries for analytical batch number 560-125820 were outside of control limits for benzyl chloride, cis-1,4-dichloro-2-butene, 1,1,1,2-tetrachloroethane, and 1,2,3-trichlorobenzene. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits. Therefore, the results are accepted.

Method 8270C – The MS/MSD recoveries for preparation batch number 560-125782 and analytical batch number 560-125807 were outside of control limits for bis(2-chloroethyl)ether, 2,4-dinitrotoluene, and 2,6-dinitrotoluene. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8270C – The method blank for preparation batch 560-125782 and analytical batch 560-125807 contained bis(2-ethylhexyl) phthalate was above the method detection limit (MDL). The analyte

concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed. The analyte was not detected in the samples; therefore, the results are accepted.

Method 8141A – The continuing calibration verification (CCV) associated with batch 280-316439 recovered above the upper control limit for merphos on the confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, results are accepted.

Method 8082A – The MS/MSD recoveries for preparation batch number 560-125817 and analytical batch number 560-125830 were outside of control limits for Aroclor 1016 and Aroclor 1260. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 6020 – The MS/MSD recoveries were outside of control limits for antimony, cadmium, lead, and manganese. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 300.0 – The MS/MSD was performed outside of hold time. The LCS was performed within hold time. The results are accepted.

Method 351.2 – The MS/MSD recoveries were outside of control limits for total kjedhal nitrogen (TKN). The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8141A, Preparation method 3510C – The MS/MSD were spiked with an unverified standard. When the extract was verified it was observed that the standard was made with two milliliters (mL) of one of the stocks rather than the usual one mL. As a result, multiple analytes are spiked at a higher concentration than usual. All recoveries were within control limits in the LCS, MS and MSDs; therefore, the results are accepted.

Method 1694 – The relative percent difference (RPD) and/or percent recovery for MS/MSD cannot be accurately calculated due to the high concentration of analyte inherent in the sample. The LCS recovery was within acceptance limits; therefore, the results are accepted.

### **Issues associated with work order 560-60099**

Method 8081B – The RPD for the MS/MSD recoveries were outside of acceptable limits for endrin ketone. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8270 – The RPD for the MS/MSD recoveries outside of acceptable limits for 4-chloroaniline. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8082A – The MS/MSD recoveries for preparation batch number 560-125817 and analytical batch number 560-125830 were outside of control limits for Aroclor 1016 and Aroclor 1260. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8082A – The MS/MSD recoveries for preparation batch number 560-125855 and analytical batch number 560-125926 were outside of control limits for Aroclor 1260. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 6020 – The MS/MSD recoveries associated with batch 125813 were outside of acceptable limits for antimony, cadmium, and lead. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 6020 – The MS/MSD recoveries associated with batch 125854 were outside of acceptable limits for manganese. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 300.0 – Samples were delayed in delivery to the lab causing nitrate analysis to exceed the hold time for HSM110, FDHSM110, HSM120, and HSM130.

Method 351.2 – The MS/MSD recoveries were outside of control limits for TKN. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8141A – Insufficient sample volume was available to perform an MS/MSD associated with analytical batch 280-316370.3510C 8141A.

Method 1694 – The RPD and/or percent recovery for MS/MSD cannot be accurately calculated due to the high concentration of analyte inherent in the sample. The LCS recovery was within acceptance limits; therefore, the results are accepted.

|                                    | <b>560-63698-9</b> (Trip Blank 12) |

**General Comments**

Although some analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation. pH values are collected in the field at the time of sample collection and are listed in the field parameters for each sample event. As such, the laboratory pH values that are flagged for hold time exceedances are not used for sample assessment purposes.

The extracted samples for method 8141A were mislabeled by the laboratory technician. The samples were not uniquely identifiable and had to be discarded. Samples were re-extracted for analysis but the hold time was exceeded. Analysis of these samples was cancelled and new samples were collected on October 24, 2016. Results of samples collected on October 24, 2016, are pending.

**Trip Blank (Comal and San Marcos)**

There were no detections in the trip blanks associated with this sample set.

**QA/QC Discussion – Comal and San Marcos Springs Surface/Base Flow Samples  
(Sampled September 8 and 9, 2016)**

**Issues associated with work order 560-63683**

Method 8260 – The MS/MSD recoveries associated with batch 131652 were outside of acceptable limits for ethylene oxide. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8260 – The RPD for the MS/MSD recoveries associated with batch number 131652 was outside of acceptable limits for naphthalene. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8151 – The MS/MSD recoveries associated with batch 449637 were outside of acceptable limits for dalapon. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 6010B – The method blank for preparation batch 560-131669 and analytical batch 560-131706 contained strontium above the MDL. The analyte concentration was less than the RL; therefore, re-extraction and/or re-analysis of samples was not performed. The method blank detections were three orders of magnitude smaller than sample results; therefore, the results are accepted.

Method 6020 – The MS/MSD recoveries associated with batch 131750 were outside of acceptable limits for aluminum. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 351.2 – The MS/MSD recoveries were outside of control limits for TKN. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 1694 – The spike recovery and/or RPD were outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS and/or LCS duplicate (LCSD) were within acceptance limits showing that the laboratory is in control and the data are acceptable.

### **Issues associated with work order 560-63698**

Method 8260B – The LCS for analytical batch 560-131686 recovered outside of control limits for chloromethane and butadiene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the results are accepted.

Method 8260B – The MS/MSD recoveries for analytical batch number 560-131686 were outside of control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8270C – The method blank for preparation batch 560-131740 and analytical batch 560-131758 contained di-n-butyl phthalate above the MDL. The analyte concentration was less than the RL; therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8151 – The MS/MSD recoveries were outside of acceptable limits for dalapon. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 6010B – The MS/MSD recoveries associated with batch 131706 were outside of acceptable limits for calcium. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 6020 – The MS/MSD recoveries associated with batch 131750 were outside of acceptable limits for aluminum. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 351.2 – The MS/MSD recoveries were outside of control limits for TKN. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 351.2 – The RPD for the MS/MSD recoveries were outside of control limits for TKN. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Preparation method 3520C – Insufficient sample volume was available to perform an MS/MSD for preparation batch 560-131740.

Method 1694 – The spike recovery and/or RPD were outside acceptance limits for the MS and/or MSD due to possible matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data are acceptable.

**Data Group Numbers (HCP surface water/base flow samples collected October 24, 2016, Comal and San Marcos Springs):**

|                                |                                |
|--------------------------------|--------------------------------|
| <b>560-64578-1</b> (HCS 110)   | <b>560-64579-1</b> (HSM 110)   |

**General Comments**

Although some analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation.

**Trip Blank (Comal and San Marcos)**

No trip blanks were required because no VOC analyses were run.

**QA/QC Discussion – Comal and San Marcos Springs Surface/Base Flow Samples  
(Sampled October 24, 2016)**

**Issues associated with work order 560-64578**

Method 8141A – The CCV associated with batch 280-350765 recovered above the upper control limit for dimethoate on the confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, results are accepted.

Method 8141A – The initial calibration verification (ICV) associated with batch 280-350765 recovered outside the control limit on one column for dischlorvos, mevinphos and azinphos-methyl. The samples associated with this ICV were non-detects for the affected analytes; therefore, results are accepted.

Method 3510C – The 8141 LCS\_00113 standard was not verified at the time of spiking, An aliquot has been sent for verification.

**Issues associated with work order 560-64579**

Method 8141A – The CCV associated with batch 280-350765 recovered above the upper control limit for dimethoate on the confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, results are accepted.

Method 8141A – The initial calibration verification (ICV) associated with batch 280-350765 recovered outside the control limit on one column for dischlorvos, mevinphos and azinphos-methyl. The samples associated with this ICV were non-detects for the affected analytes; therefore, results are accepted.

Method 8141A – The triphenylphosphate surrogate recovery for the following sample in preparation batch 280-349084 and analytical batch 280-350765 was outside acceptance limits (low biased) on the back/confirmation column: HSM120 (560-64579-3). The recovery is within acceptance limits on the other column, indicating that the extraction process was in control. Results are accepted.

Method 8141A - Surrogate chlormefos recovery for the following sample in preparation batch 280-349084 and analytical batch 280-350765 was outside control limits: HSM150 (560-64579-6). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

**Data Group Numbers (HCP stormwater samples collected March 9, 2016, at San Marcos Springs):**

|                                    |                                       |

**General Comments**

Although some analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation. pH values are collected in the field at the time of sample collection and are listed in the field parameters for each sample event. As such, the laboratory pH values that are flagged for hold time exceedances are not used for sample assessment purposes.

Lead and peak samples were collected outside of laboratory operating hours. Therefore lead and peak *E. coli* samples were analyzed outside of their hold times.

The caffeine sample container for HSM230 Peak was broken in transit to the laboratory and was not analyzed.

**Trip Blank**

There were no detections in the trip blank associated with these samples.

**QA/QC Discussion – San Marcos Springs Stormwater Samples  
(Sampled March 9, 2016)**

**Issues associated with work order 560-60183**

Method 8260B – The MS/MSD recoveries for analytical batch number 560-125954 was outside of control limits for ethylene oxide. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8260B – The RPD for the MS/MSD recoveries was outside of acceptable limits for ethylene oxide. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8270C – The MS/MSD recoveries for preparation batch number 560-126050 and analytical batch number 560-126070 were outside of control limits for various analytes. Sample matrix interference is suspected because the associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8270C – The MS/MSD recoveries for preparation batch number 560-125968 and analytical batch number 560-125986 were outside of control limits for indeno(1,2,3-cd)pyrene. Sample matrix interference is suspected because the associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8270C – The RPD for the MS/MSD recoveries was outside of acceptable limits for various analytes. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8270C – The surrogate recovery for the following sample was outside control limits: (560-60183-I-5-A MS). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8270C – The method blank for preparation batch 560-126050 and analytical batch 560-126070 contained bis(2-ethylhexyl) phthalate above the MDL. The analyte concentration was less than the RL; therefore, re-extraction and/or re-analysis of samples was not performed. The analyte was not detected in the samples; therefore, the results are accepted.

Method 8141A – The CCV associated with batches 280-317060 and 280-317425 recovered above the upper control limit for dichlorvos on the confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, results are accepted.

Method 8082A – The MS/MSD recoveries for preparation batch number 560-125982 and analytical batch number 560-126039 were outside of control limits for Aroclor 1260. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 6020 – The serial dilution performed for the following sample associated with batch 560-125994 was outside control limits: Al 11% (560-60182-A-1-A SD)

Method 6020 – The CCV associated with batch 560-125994 recovered above the upper control limit for beryllium. The recoveries were in the middle of the acceptance range so that the high CCV did not affect whether the samples met the pass/fail criteria. The samples associated with this CCV were non-detects for the affected analytes; therefore, the results are accepted.

Method 6010B – The method blank for preparation batch 560-126005 and analytical batch 560-126018 contained sodium above the MDL. The analyte concentration was less than the RL; therefore, re-extraction and/or re-analysis of samples was not performed. The results are accepted.

Method 6010B – The method blank for preparation batch 560-125967 and analytical batch 560-125994 contained selenium above the MDL. The analyte concentration was less than the RL; therefore, re-extraction and/or re-analysis of samples was not performed.

Method 6020 – The CCV associated with batch 560-126076 recovered above the upper control limit for beryllium. All QA/QC analyses were in the middle of the acceptance range and not effected by the high CCV. The samples associated with this CCV were non-detects for the affected analytes; therefore, results are accepted.

Method 7470A – The MS/MSD recoveries associated with batch 126107 were outside of acceptable limits for mercury. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method SM 2320B – There is no substituent recovery of carbonate alkalinity and bicarbonate alkalinity for MS/MSDs.

Method 351.2 – The MS/MSD recoveries were outside of control limits for TKN for batches 184408 and 184530. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 300.0 – The MS/MSD recoveries for batch 125971 were outside of control limits for chloride and/or sulfate and/or bromide. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 351.2 – The RPD for the MS/MSD recoveries were outside of control limits for TKN. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 300.0 – The method blank for analytical batch 560-125971 contained chloride above the MDL. The analyte concentration was less than the RL; therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8141A and Preparation method 3510C – HSM230 Lead, HSM230 Trail, and FDHSM230 Trail formed emulsions during the extraction procedure. The emulsions were broken up using a pour back on all of the first extractions from analytical batch 280-316652.

Preparation method 3520C – Insufficient sample provided for 3520C resulted in the use of higher reporting limits for samples: HSM240 Lead, HSM260 Lead, HSM210 Peak, HSM230 Trail, HSM260 Trail, HSM240 Peak, FDHSM231 Trail, and HSM240 Trail.

Method 1694 – The concentration indicated for HSM230 Lead is an estimated value above the calibration range.

Method 1694 – The RPD and/or percent recovery for this QC spike sample cannot be accurately calculated due to the high concentration of analyte inherent in the sample.

**Data Group Numbers (HCP stormwater samples collected April 12–13, 2016, at Comal Springs):**

|                                    |                                       |

**General Comments**

Although some analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation. pH values are collected in the field at the time of sample collection and are listed in the field parameters for each sample event. As such, the laboratory pH values that are flagged for hold time exceedances are not used for sample assessment purposes. Lead and peak samples were collected outside of laboratory operating hours. Therefore lead and peak *E. coli* samples were analyzed outside of their hold times.

**Trip Blanks**

There were no detections in the trip blank associated with these samples.

**QA/QC Discussion – Comal Springs Stormwater Samples  
(Sampled April 12 and 13, 2016)**

**Issues associated with work order 560-60893**

Method 8260 – The MS/MSD recoveries were outside of acceptable limits for ethylene oxide and 3,3-dichlorobenzene. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8260 – The RPD for the MS/MSD recoveries was outside of acceptable limits for cyclohexane, 1,4-dioxane, and 4-chloroaniline. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8260 – The RPD for the MS/MSD recoveries for batch 126945 was outside of acceptable limits for acetonitrile, 1,4-dioxane, isobutyl alcohol, and 2-nitropropane. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8260 – The MS/MSD recoveries associated with batch 126945 were outside of acceptable limits for ethylene oxide, isooctane, and 2-nitropropane. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8081 – The MS/MSD recoveries were outside of acceptable limits for Aldrin and 4,4-DDE. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8081 – The RPD for the MS/MSD recoveries was outside of acceptable limits for cyclohexane, 1,4-dioxane, and 4-chloroaniline. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

**General Comments**

Although some analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation. pH values are collected in the field at the time of sample collection and are listed in the field parameters for each sample event. As such, the laboratory pH values that are flagged for hold time exceedances are not used for sample assessment purposes. Lead and peak samples were collected outside of laboratory operating hours. Therefore lead and peak *E. coli* samples were analyzed outside of their hold times.

**Trip Blanks**

There were no detections in the trip blank associated with these samples.

**QA/QC Discussion – Comal Springs Stormwater Samples  
(Sampled September 26-27, 2016)**

**Issues associated with work order 560-63976**

Method 8260 - Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 132164 were outside acceptable limits for Ethylene oxide. The LCS was within acceptable limits. Therefore, results are accepted.

Method 8141A - The grand mean exception, as outlined in EPA method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 280-345644 for several compounds. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average percent difference (the grand mean) of all the compounds in the CCV is less than or equal to 15% difference with no single percent difference more than 30%. All associated samples are ND for the affected compounds. Both surrogates are well in control on both columns and not affected by any bias.

Method 8141A - The continuing calibration verification (CCV) associated with batch 280-345644 recovered outside acceptance criteria, low biased, for Naled. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the results are accepted.

Method 8141A - The initial calibration verification (ICV) for Mevinphos associated with analytical batch 280-345644 recovered below the lower control limit on the back/confirmation column. The samples associated with this ICV were non-detects for the affected analytes; therefore, the data have been reported from the front/primary column which is in control. The results are accepted

Method 8141A - The Chlormefos surrogate recovery for the following sample in preparation batch 280-344653 and analytical batch 280-345644 was outside acceptance limits (low biased) on the back/confirmation column: (560-64002-Q-2-A MS). The recovery is within acceptance limits on the other column, indicating that the extraction process was in control. The bracketing CCV for Chlormefos recovered below the lower limit but the surrogate is in control on the same column without bias. The sample is a matrix spike and all spiked compounds are well in control on both columns.

Method 8082A - Two surrogates are used for this analysis. The laboratory's standard operating procedure (SOP) allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: (MB 560-132158/1-A). These results have been reported and qualified.

Method 8081B - The following continuing calibration verification (CCV) associated with batch 560-132177 recovered above the upper control limit for toxaphene: (CCV 560-132177/4). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8081B - Two surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: (MB 560-132158/1-A). These results have been reported and qualified.

Method 8151 - Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 452263 were outside acceptable limits for Dalapon. The LCS was within acceptable limits. Therefore, data are reported.

Method 6010B - The method blank for preparation batch 560-132189 and analytical batch 560-132326 contained Na and Sr above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 6010 - Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 132326 and prep batch 132189 were outside acceptable limits for Sodium. The LCS was within acceptable limits. Therefore, data are reported.

Method 3510C - The following samples were spiked with unverified standards: 8141 Surr\_00079, 8141 LCS\_000112, HCS210 Lead (560-63976-1), HCS240 Lead (560-63976-2), HCS250 Lead (560-63976-3), HCS260 Lead (560-63976-4) and HCS270 Lead (560-63976-5).

Method 3510C - The following samples formed emulsions during the extraction procedure: HCS210 Lead (560-63976-1), HCS240 Lead (560-63976-2), HCS250 Lead (560-63976-3), HCS260 Lead (560-63976-4) and HCS270 Lead (560-63976-5). The emulsions were broken up using a pour back method on all three extractions.

Method 3520C - Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 560-132246.

### **Issues associated with work order 560-63977**

Method 8260 - Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 132164 were outside acceptable limits for Ethylene oxide. The LCS was within acceptable limits. Therefore, data are reported.

Method 8270 - Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 132347 were outside acceptable limits for various analytes. The LCS was within acceptable limits. Therefore, data are reported.

Method 8141A - The grand mean exception, as outlined in EPA method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 280-345644 for several compounds. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average percent difference (the grand mean) of all the compounds in the CCV is less than or equal to 15% difference with no single percent difference more than 30%. All associated samples are ND for the affected compounds. Both surrogates are well in control on both columns and not affected by any bias.

Method 8141A - The continuing calibration verification (CCV) associated with batch 280-345644 recovered outside acceptance criteria, low biased, for Naled. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method 8141A - The initial calibration verification (ICV) for Mevinphos associated with analytical batch 280-345644 recovered below the lower control limit on the back/confirmation column. The samples associated with this ICV were non-detects for the affected analytes; therefore, the data have been reported from the front/primary column which is in control.

Method 8141A - The Chlormefos surrogate recovery for the following sample in preparation batch 280-344653 and analytical batch 280-345644 was outside acceptance limits (low biased) on the back/confirmation column: (560-64002-Q-2-A MS). The recovery is within acceptance limits on the other column, indicating that the extraction process was in control. The bracketing CCV for Chlormefos

recovered below the lower limit but the surrogate is in control on the same column without bias. The sample is a matrix spike and all spiked compounds are well in control on both columns.

Method 8082A - Two surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: (MB 560-132158/1-A). These results have been reported and qualified.

Method 8081B - The following continuing calibration verification (CCV) associated with batch 560-132177 recovered above the upper control limit for toxaphene: (CCV 560-132177/4). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8081B - Two surrogates are used for this analysis. The laboratory's SOP allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: (MB 560-132158/1-A). These results have been reported and qualified.

Method 8151 - Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 452263 were outside acceptable limits for Dalapon. The LCS was within acceptable limits. Therefore, data are reported.

Method 6010B - The method blank for preparation batch 560-132189 and analytical batch 560-132326 contained Na and Sr above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 6010 - Percent recovery results for the MS/MSD pair, the MS or the MSD associated with prep batch 132189 were outside acceptable limits for Sodium. The LCS was within acceptable limits. Therefore, data are reported.

Method(s) 3510C - The following samples formed emulsions during the extraction procedure: HCS210 Peak 2 (560-63977-1), HCS240 Peak 2 (560-63977-2), HCS250 Peak 2 (560-63977-3), HCS260 Peak 2 (560-63977-4) and HCS270 Peak 2 (560-63977-5). The emulsions were broken up using a pour back method on all three extractions.

Method(s) 3520C - Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 560-132246.

Method(s) 3520C - Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 560-132382.

#### **Issues associated with work order 560-64002**

Method 8260 - The relative percent deviation (RPD) was outside acceptable limits for 1, 4-Dioxane in the MS/MSD pair associated with batch 132278. The LCS was within acceptable limits. Therefore, data are reported.

Method 8260 - The relative percent deviation (RPD) was outside acceptable limits for 1, 4-Dioxane in the MS/MSD pair associated with batch 132278. The LCS was within acceptable limits. Therefore, data are reported.

Method 8260 - Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 132311 were outside acceptable limits for various analytes. The LCS was within acceptable limits. Therefore, data are reported.

Method 8260 - The relative percent deviation (RPD) was outside acceptable limits for Ethylene oxide in the MS/MSD pair associated with batch 132311. The LCS was within acceptable limits. Therefore, data are reported.

Method 8260 - Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 132347 were outside acceptable limits for various analytes. The LCS was within acceptable limits. Therefore, data are reported.

Method 8141A - The grand mean exception, as outlined in EPA method 8000B, was applied to the continuing calibration verification (CCV) standard associated with batch 280-345644 for several compounds. This rule states that when one or more compounds in the CCV fail to meet acceptance criteria, the initial calibration (ICAL) may be used for quantitation if the average percent difference (the grand mean) of all the compounds in the CCV is less than or equal to 15% difference with no single percent difference more than 30%. All associated samples are ND for the affected compounds. Both surrogates are well in control on both columns and not affected by any bias.

Method 8141A - The continuing calibration verification (CCV) associated with batch 280-345644 recovered outside acceptance criteria, low biased, for Naled. A reporting limit (RL) standard was analyzed, and the target analyte was detected. Since the associated samples were non-detect for this analyte, the data have been reported.

Method 8141A - The initial calibration verification (ICV) for Mevinphos associated with analytical batch 280-345644 recovered below the lower control limit on the back/confirmation column. The samples associated with this ICV were non-detects for the affected analytes; therefore, the data have been reported from the front/primary column which is in control.

Method 8141A - The Chlormefos surrogate recovery for the following samples in preparation batch 280-344653 and analytical batch 280-345644 was outside acceptance limits (low biased) on the front/primary column: HCS260 Trail (560-64002-5), FDHCS260 Trail (560-64002-6), HCS270 Trail (560-64002-12) and FDHCS270 Trail (560-64002-13). The recovery is within acceptance limits on the other column, indicating that the extraction process was in control.

Method 8141A - The Chlormefos surrogate recovery for the following sample in preparation batch 280-344653 and analytical batch 280-345644 was outside acceptance limits (low biased) on the back/confirmation column: HCS210 Trail (560-64002-2[MS]). The recovery is within acceptance limits on the other column, indicating that the extraction process was in control. The bracketing CCV for Chlormefos recovered below the lower limit but the surrogate is in control on the same column without bias. The sample is a matrix spike and all spiked compounds are well in control on both columns.

Method 8081B - The following continuing calibration verification (CCV) associated with batch 560-132295 recovered above the upper control limit for toxaphene: (CCV 560-132295/4). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8151 - Percent recovery results for the MS/MSD pair, the MS or the MSD associated with batch 452263 were outside acceptable limits for Dalapon. The LCS was within acceptable limits. Therefore, data are reported.

Method 3510C - The following samples were spiked with a unverified standards: 8141 Surr\_00079, 8141 LCS\_000112, HCS210 Trail (560-64002-2), HCS210 Trail (560-64002-2[MS]), HCS210 Trail (560-64002-2[MSD]), HCS240 Trail (560-64002-3), HCS250 Trail (560-64002-4), HCS260 Trail (560-64002-5), FDHCS260 Trail (560-64002-6), HCS270 Trail (560-64002-12) and FDHCS270 Trail (560-64002-13).

Method 3510C - The following samples formed emulsions during the extraction procedure: HCS210 Trail (560-64002-2), HCS210 Trail (560-64002-2[MS]), HCS210 Trail (560-64002-2[MSD]), HCS240 Trail (560-64002-3), HCS250 Trail (560-64002-4), HCS260 Trail (560-64002-5), FDHCS260 Trail (560-64002-6), HCS270 Trail (560-64002-12) and FDHCS270 Trail (560-64002-13). The emulsions were broken up using a pour back method on all three extractions.

Method 3520C - Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 560-132382.

#### **Issues associated with EPA Method 1694**

The relative percent difference and/or percent recovery for the quality control spike samples cannot be accurately calculated due to high concentration of analyte inherent in the sample.

Although some analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation. pH values are collected in the field at the time of sample collection and are listed in the field parameters for each sample event. As such, the laboratory pH values that are flagged for hold time exceedances are not used for sample assessment purposes.

All samples were collected outside of laboratory operating hours. Therefore *E. coli* samples were analyzed outside of their hold times.

The organophosphorous pesticide sample container for HSM210 Trail was delayed internally at the contract laboratory and was processed outside of hold time.

**Trip Blank**

There were no detections in the trip blank associated with these samples.

## **QA/QC Discussion – San Marcos Springs Stormwater Samples (Sampled November 3, 2016)**

### **Issues associated with work order 560-64786**

Method(s) 8260B - Due to the high concentration of Benzene, the matrix spike / matrix spike duplicate (MS/MSD) for analytical batch 560-133589 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method(s) 8260B - The matrix spike duplicate (MSD) recovery for analytical batch 560-133589 were outside control limits for 1-octene. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method(s) 8270C - The laboratory control sample (LCS) for preparation batch 560-133681 and analytical batch 560-133691 recovered outside control limits for the following analytes: Bis(2-ethylhexyl) phthalate. This analyte was biased high in the LCS and was not detected in the associated samples above the RL; therefore, the data have been reported. The MS/MSD had passing %R for all targets.

Method(s) 8141A - The Chlormefos surrogate recovery for the following sample in preparation batch 280-350606 and analytical batch 280-351570 was outside acceptance limits (low biased) on the front/primary column: HSM270 Lead (560-64786-7). The recovery is within acceptance limits on the other column, indicating that the extraction process was in control.

Method(s) 8141A - The continuing calibration verification (CCV) for Coumaphos, Chlormefos and Azinphos-methyl associated with analytical batch 280-351570 recovered outside the control limit on the back/confirmation column. The samples associated with this CCV were well in control for both surrogates on both columns; therefore, the data have been reported from the front/primary column which is in control. The associated sample was ND for Azinphos-methyl and Coumaphos and are reported from the front/primary column, which is in control.

Method(s) 8141A - The continuing calibration verification (CCV) for Chlormefos, Dimethoate, Coumaphos and Disulfoton associated with analytical batch 280-351570 recovered outside the control limit on one column. The samples associated with this CCV were well in control for both surrogates on both columns; therefore, the data have been reported from the back/confirmation column which is in control. The associated sample was ND for Coumaphos, Dimethoate and Disulfoton and are reported from the front/primary column, which is in control.

Method(s) 8141A - The initial calibration verification (ICV) for Mevinphos, Azinphos-methyl and Dichlorvos associated with analytical batch 280-351570 recovered outside the control limit on one column. The samples associated with this ICV were non-detects for the affected analytes; therefore, the data have been reported from the column which is in control.

Method(s) 8141A - The ISTD expired at midnight of 11/15/16. The analytical run was set up on the 15th and continued thru 11/16/16: HSM210 Lead (560-64786-1), HSM230 Lead (560-64786-2), HSM231 Lead (560-64786-3), HSM240 Lead (560-64786-4), HSM250 Lead (560-64786-5), HSM260 Lead (560-64786-6), HSM270 Lead (560-64786-7), HSM210 Peak (560-64786-9), HSM230 Peak (560-64786-10), HSM231 Peak (560-64786-11), HSM240 Peak (560-64786-12), HSM250 Peak (560-64786-13), HSM260 Peak (560-64786-14), HSM270 Peak (560-64786-15), FDHSM210 Trail (560-64786-17), HSM230 Trail (560-64786-18), FDHSM230 Trail (560-64786-19), HSM231 Trail (560-64786-20), FDHSM231 Trail (560-64786-21), HSM240 Trail (560-64786-22), HSM250 Trail (560-64786-23), HSM260 Trail (560-64786-24), HSM260 Trail (560-64786-24[MS]), HSM260 Trail (560-64786-24[MSD]), HSM270 Trail (560-64786-25), HSM270 Trail (560-64786-25[MS]), HSM270 Trail (560-64786-25[MSD]), (CCV 280-

351570/27), (CCV 280-351570/42), (CCV 280-351570/54), (LCS 280-350606/2-A), (LCS 280-350683/2-A), (LCSD 280-350606/3-A) and (MB 280-350606/1-A)

Method(s) 8141A - The continuing calibration verification (CCV) for Merphos associated with analytical batch 280-352316 recovered above the upper control limit on the back/confirmation column. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported from the front/primary column which is in control.

Method(s) 8141A - The initial calibration verification (ICV) for Merphos associated with analytical batch 280-352316 recovered above the upper control limit on the front/primary column. The samples associated with this ICV were non-detects for the affected analytes; therefore, the data have been reported from the column which is in control.

Method(s) 8141A - The initial calibration verification (ICV) result for batch 280-354760 was outside the control limits on one column. Sample results were non-detects and reported from the column in control. Results have been reported as qualified data.

Method(s) 8141A - The continuing calibration verification (CCV) associated with batch 280-354760 recovered above the upper control limit for Mevinphos and Dichlorvos on the front column. The samples associated with this CCV were non-detects for the affected analytes and are reported from the back column; therefore, the data have been reported. The following sample is impacted: HSM210 Trail (560-64786-16).

Method(s) 8141A - The following sample had low surrogate recoveries with no obvious matrix: HSM210 Trail (560-64786-16). Per DV-QA-18P reextraction out of hold will not be done without client approval.

Method(s) 8151A - The closing continuing calibration verification (CCV) associated with batch 680-457888 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: HSM260 Peak (560-64786-14), HSM270 Peak (560-64786-15), (CCV 680-457888/43), (680-131875-A-

1-I), (680-131875-A-1-J MS), (680-131875-A-1-K MSD), (680-132059-A-4-A) and (680-132059-A-4-B MS).

Method(s) 8151A - Surrogate recovery for the following sample was outside control limits: HSM260 Peak (560-64786-14) and HSM270 Peak (560-64786-15). Re-extraction and/or re-analysis was performed outside of holding time with acceptable results.

Method(s) 6010B - The method blank for preparation batch 560-133618 and analytical batch 560-133668 contained Ca above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method(s) 365.4 - The method blank for preparation batch 680-456744 and analytical batch 680-457065 contained phosphorus above the method detection limit (MDL). Associated sample(s) were not re-extracted and/or re-analyzed because results were greater than 10X the value found in the method blank.

Method(s) 365.4 - Due to the high concentration of phosphorus, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 680-456744 and analytical batch 680-457065 could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Method(s) 3510C - Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with Batch: 350606

Method(s) 3510C - 8141 LCS\_00113 was not verified prior to use. LCS is in the process of verification.

Method(s) 3510C - The following sample formed emulsions during the extraction procedure: HSM260 Lead (560-64786-6) and HSM270 Lead (560-64786-7). The emulsions were broken up using a pour back on the first and second extractions.

Method(s) 3510C - 8141 LCS\_00113 was not verified at the time of spiking. An aliquot has been sent for analysis. Preparation batch is 280-350683.

Method(s) 3510C - Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate/sample duplicate (MS/MSD/DUP) associated with preparation batch 280-353905.

Method(s) 3510C - The following sample(s) was prepared outside of preparation holding time due to sample was received by internal laboratory shipment out of hold time. Preparation batch is 280-353905.

Method(s) 3520C - Elevated reporting limits are provided for the following samples due to insufficient sample provided for 3520c preparation/analysis: FDHSM230 Trail (560-64786-19), HSM231 Trail (560-64786-20) and HSM240 Trail (560-64786-22).

Method 1694 - The relative percent difference and/or percent recovery for the quality control spike samples cannot be accurately calculated due to high concentration of analyte inherent in the sample.

**Data Group Numbers (HCP sediment samples collected June 8 and 9, 2016, at Comal and San Marcos Springs):**

**General Comments**

Although some analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation. Samples were collected in glass jars using stainless steel trowels. The water depth and sediment availability at HCS 330 made collection with a trowel impossible. The HCS 330 sample was collected in a plastic sleeve using a hand core sampler and extruded into the glass sample jars.

**Trip Blanks**

There were no detections in the trip blanks associated with these samples.

**Equipment Blanks**

Two equipment blanks were collected. One sample was collected by pouring American Society for Testing and Materials (ASTM) Type II Reagent Grade water over a decontaminated trowel. The second sample was collected by pouring ASTM Type II Reagent Grade water through a new sample tube. The laboratory provided the water used for equipment blanks but did not supply a sufficient volume. Equipment blank metals samples were collected separately, after the laboratory provided additional water.

There were several compounds detected in both of the two equipment blanks. The detections are similar between each blank despite the differences in sampling equipment. SWCA suspects that the detected compounds were present in the ASTM Type II Reagent Grade water used. The plastic sample tube was a new, single-use tube from the box and was therefore not decontaminated, eliminating decontamination procedures as the source of interference. Many of the detections were “J” flagged and substantially lower than the levels detected in the sediment samples. Therefore, the equipment blank analyses results are not anticipated to have affected the usability of results of the sediment sample analyses. The equipment blank detections are summarized in Table 1.

**Table 1. Detections in Sediment Equipment Blanks June 2016**

| Sample | Associated Equipment | Calcium<br>mg/L | Bis(2-ethylhexyl) Phthalate<br>µg/L | Chloride<br>mg/L | Fluoride<br>mg/L | Nitrate<br>mg/L | Phenol<br>µg/L | Silicon<br>mg/L | Sodium<br>mg/L | Total Organic Carbon<br>mg/L |

## **QA/QC Discussion – Comal and San Marcos Springs Sediment Samples (Sampled June 8, and 9, 2016)**

### **Issues associated with work order 560-62017**

Method 8260 – The MS/MSD recoveries were outside of control limits for various analytes. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8260 – The RPD for the MS/MSD recoveries were outside of control limits for various analytes. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8270C – Surrogate recovery for the following samples was outside control limits: HCS360 (560-62017-5) and FDHCS360 (560-62017-6). Re-extraction and re-analysis was performed with concurring results. The original analysis has been reported.

Method 8270C – The MS/MSD recoveries were outside of control limits for various analytes. The associated LCS recovery was within acceptance limits. Therefore, the results are accepted.

Method 8141A: The following samples were diluted due to the nature of the sample matrix: HCS310 (560-62017-1), HCS320 (560-62017-2), HCS330 (560-62017-3), HCS340 (560-62017-4), HCS340 (560-62017-4[MS]), HCS340 (560-62017-4[MSD]), HCS360 (560-62017-5), and FDHCS360 (560-62017-6). Elevated RLs are provided. When run at a lower dilution the samples caused CCV failure. The matrix caused failed very low in the CCVs. The dilutions were also performed in order to protect the analytical instrumentation. Due to the dilution, the surrogate and matrix spike concentration in the samples were reduced to a level where the recovery calculation does not provide useful information.

Method 8141A – The CCV associated with batch 280-332552 recovered above the upper control limit for dichlorvos, dimethoate, and mevinphos. The samples associated with this CCV were non-detects for the affected analytes; therefore, results are accepted.

Method 8082A – Two surrogates are used for this analysis. The laboratory's standard operating procedure allows one of these surrogates to be outside acceptance criteria without performing re-extraction/re-analysis. The following sample contained an allowable number of surrogate compounds outside limits: (CCVIS 560-129231/1). These results have been reported and qualified.

Method 8151A – The CCV associated with batch 600-191143 recovered above the upper control limit for 2,4-DB(15.7%). The samples associated with this CCV were non-detects for the affected analytes; therefore, the results are accepted. The following sample is impacted: (CCVRT 600-191143/2).

Method 8151A – The MS/MSD recoveries for preparation batch 600-190936 and analytical batch 600-191143 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. The results are accepted.

Method 8151A – The CCV associated with batch 600-191143 recovered above the upper control limit for 2,4,5-T(17.3%) and 2,4-DB(43.8%). The samples associated with this CCV were non-detects for the

affected analytes; therefore, the results are accepted. The following sample is impacted: (CCV 600-191143/13).

Method 8151A – The MS/MSD/sample duplicate (DUP) precision for preparation batch 600-190936 and analytical batch 600-191143 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected. The results are accepted.

Method 8151A – The 2,4-DB concentration was outside the calibration range, however, the percent recovery was within the control limits. (LCS 600-190936/2-A). The results are accepted.

Method 8151A – Surrogate recovery for the following sample was outside control limits: HCS330 (560-62017-3). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8151A – Surrogate recovery for the following sample was outside control limits: HCS360 (560-62017-5). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8151A – The CCV associated with batch 600-191143 recovered above the upper control limit for 2,4-DB(46.2%). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: (CCV 600-191143/24).

Method 8081B – The LCS and/or LCSD for preparation batch 600-190731 and analytical batch 600-191263 recovered outside control limits for the following analytes: methoxychlor. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the results are accepted.

Method 8081B – The CCV associated with batch 600-191263 recovered above the upper control limit for 4,4-DDT(22.8%) and Methoxychlor(39.1%). The samples associated with this CCV were non-detects for the affected analytes; therefore, the results are accepted. The following sample is impacted: (CCVIS 600-191263/3).

Method 8081B – Compound internal standard (ISTD) eluted outside the retention time window on the RTX-CLPesticides II column for the following samples: (LCS 600-190731/2-A) and (MB 600-190731/1-A). This retention time shift was taken into account when reviewing the sample(s) for target compounds.

Method 8081B – The MS/MSD recoveries for preparation batch 600-190731 and analytical batch 600-191263 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. The results are accepted.

Method 8081B – The MS/MSD/Duplicate (DUP) precision for preparation batch 600-190731 and analytical batch 600-191263 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected.

Method 8081B – Compound ISTD eluted outside the retention time window on the RTX-CLPesticides I and RTX-CLPesticides II column for the following samples: HCS360 (560-62017-5). This retention time shift was taken into account when reviewing the sample(s) for target compounds.

Method 8081B – Compound ISTD eluted outside the retention time window on the RTX-CLPesticides II column for the following sample: FDHCS360 (560-62017-6). This retention time shift was taken into account when reviewing the sample(s) for target compounds.

Method 8081B – Surrogate recovery for the following sample was outside control limits: FDHCS360 (560-62017-6). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 6010B – Due to the high concentration of calcium, the MS/MSD for preparation batch 560-128926 and analytical batch 560-129037 could not be evaluated for accuracy and precision. The associated LCS met acceptance criteria. The results are accepted.

Method 6010 – The RPD was outside acceptable limits for various analytes in the MS/MSD pair associated with sample 560-62017-4. The LCS was within acceptable limits. Therefore, data are reported. The results are accepted.

Method 300.0: The following samples were analyzed outside of holding time for nitrates due to an error at the laboratory: HCS310 (560-62017-1), HCS320 (560-62017-2), HCS330 (560-62017-3), HCS340 (560-62017-4), HCS360(560-62017-5), and FDHCS360 (560-62017-6).

Method 300.0 – The MS/MSD recoveries for Bromide preparation batch 600-191188 and analytical batch 600-191189 were outside control limits. Sample matrix interference is suspected because the associated LCS recovery was within acceptance limits. The results are accepted.

Preparation Method 3540C – Sample HCS340 could not be thoroughly homogenized because the sample contained shells.

Preparation Method 3546 – Due to the matrix, the HCS310, HCS340, HCS360, and FDHCS360 could not be concentrated to the final method required volume. The reporting limits are elevated proportionately. The results are accepted.

## **Issues associated with work order 560-62041**

Method 8260B –HMSM350 (560-62041-5) was analyzed using less sample weight due to the internal standard failures in the original 1X analysis. Elevating reporting limits are provided.

Method 8260B – The method blank for analytical batch 560-129009 contained methylene chloride above the method detection limit. This target analyte concentration was less than the RL; therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8260B – The LCS for analytical batch 560-129047 recovered outside control limits for the following analytes: ethylene oxide. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the results are accepted.

Method 8270C – The MS/MSD precision for preparation batch 560-128987 and analytical batch 560-129026 was outside control limits. Sample matrix interference is suspected.

Method 8270C – Due to sample matrix effect on the ISTD, a dilution was required for the following sample: HMSM330 (560-62041-3).

Method 8141A – The CCV associated with batch 280-331214 recovered above the upper control limit for dichlorvos. The samples associated with this CCV were non-detects for the affected analytes; therefore, the results are accepted. The following samples are impacted: EB01 (560-62041-10) and EB02 (560-62041-11).

Method 8141A – The following samples were diluted due to the nature of the sample matrix: HMSM310 (560-62041-1), HMSM320 (560-62041-2), HMSM330 (560-62041-3), HMSM340 (560-62041-4), HMSM350 (560-62041-5), HMSM360 (560-62041-6), HSM370 (560-62041-7), and FDHSM370 (560-62041-8). Elevated RLs are provided. When run at a lower dilution the samples caused CCV failure. The matrix caused failed very low in the CCVs. The dilutions were also performed in order to protect the analytical instrumentation. Due to the dilution, the surrogate and matrix spike concentration in the samples were reduced to a level where the recovery calculation does not provide useful information.

Method 8141A – The CCV associated with batch 280-332552 recovered above the upper control limit for dichlorvos, dimethoate and mevinphos. The samples associated with this CCV were non-detects for the affected analytes; therefore, the results are accepted. The following samples are impacted: HMSM310 (560-62041-1), HMSM320 (560-62041-2), HMSM330 (560-62041-3), HMSM340 (560-62041-4), HMSM350 (560-62041-5), HMSM360 (560-62041-6), HSM370 (560-62041-7), and FDHSM370 (560-62041-8).

Method 8082A – The method blank for preparation batch 560-129018 contained Aroclor 1260 above the RL. None of the samples associated with this method blank contained the target compound; therefore, re-extraction and/or re-analysis of samples were not performed. The results are accepted.

Method 8151A – The CCV associated with batch 600-191143 recovered above the upper control limit for 2,4-DB(15.7%). The samples associated with this CCV were non-detects for the affected analytes;

therefore, the data have been reported. The results are accepted. The following sample is impacted: (CCVRT 600-191143/2).

Method 8151A – The MS/MSD recoveries for preparation batch 600-190936 and analytical batch 600-191143 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. The results are accepted.

Method 8151A – The CCV associated with batch 600-191143 recovered above the upper control limit for 2,4,5-T(17.3%) and 2,4-DB(43.8%). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: (CCV 600-191143/13). The results are accepted.

Method 8151A – The MS/MSD recoveries for preparation batch 600-190936 and analytical batch 600-191143 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits. The results are accepted.

Method 8151A – The MS/MSD/DUP precision for preparation batch 600-190936 and analytical batch 600-191143 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected.

Method 8151A – The 2,4-DB concentration was outside the calibration range, however, the %R was within the control limits. The results are accepted.

Method 8151A – The CCV associated with batch 600-191143 recovered above the upper control limit for 2,4-DB(46.2%). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: (CCV 600-191143/24). The results are accepted.

Method 8151A – The CCV associated with batch 600-191259 recovered above the upper control limit for 2,4-DB(37.3%) and Dinoseb(37.3%). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: (CCVRT 600-191259/2). The results are accepted.

Method 8151A – The LSC and/or LCSD for preparation batch 600-190717 and analytical batch 600-190893 recovered outside control limits for the following analyte(s): dinoseb. Dinoseb has been identified as a poor performing analyte when analyzed using this method; therefore, re-extraction/re-analysis was not performed.

Method 8151A: The MS/MSD recoveries for preparation batch 600-190598 and 600-190717 and analytical batch 600-190893 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. The results are accepted.

Method 8151A: The CCV associated with batch 600-190893 recovered above the upper control limit for 2,4-DB(39.2%) and dinoseb(53.7%). The samples associated with this CCV were non-detects for the

affected analytes; therefore, the data have been reported. The following sample is impacted: (CCV 600-190893/13). The results are accepted.

Method 8081B – Surrogate recovery for the following sample was outside control limits: HSM340 (560-62041-4). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8081B – Compound ISTD eluted outside the retention time window on the RTX-CLPesticides II column for the following sample: (MB 600-190731/1-A). This retention time shift was taken into account when reviewing the sample(s) for target compounds.

Method 8081B – The LCS and/or LCSD for preparation batch 600-190731 and analytical batch 600-191263 recovered outside control limits for the following analytes: methoxychlor. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported. The results are accepted.

Method 8081B – Compound ISTD eluted outside the retention time window on the RTX-CLPesticides II column for the following sample: (LCS 600-190731/2-A). This retention time shift was taken into account when reviewing the sample(s) for target compounds.

Method 8081B – The MS/MSD recoveries for preparation batch 600-190731 and analytical batch 600-191263 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. The results are accepted.

Method 8081B – Compound ISTD eluted outside the retention time window on the RTX-CLPesticides II column for the following samples: HSM310 (560-62041-1) and HSM320 (560-62041-2). This retention time shift was taken into account when reviewing the sample(s) for target compounds.

Method 8081B – Compound ISTD eluted outside the retention time window on the RTX-CLPesticides II column for the following samples: HSM340 (560-62041-4), HSM350 (560-62041-5), and HSM360 (560-62041-6). This retention time shift was taken into account when reviewing the sample(s) for target compounds.

Method 8081B – The CCV associated with batch 600-191263 recovered above the upper control limit for 4,4-DDT(22.8%) and Methoxychlor(39.1%). The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following sample is impacted: (CCVIS 600-191263/3).

Method 300.0 – The MS/MSD recoveries for bromide, chloride, sulfate analytical batch 600-190667 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated LCS recovery was within acceptance limits. The results are accepted.

Method 300.0 – Samples were received outside of holding time for nitrates, due to shipping error by laboratory.

Method 300.0 – The MS/MSD recoveries for Bromide preparation batch 600-191188 and analytical batch 600-191189 were outside control limits. Sample matrix interference is suspected because the associated LCS recovery was within acceptance limits. The results are accepted.

Method 3510C/8141A – Insufficient sample volume was available to perform a MS/MSD associated with analytical batch 280-330102. (8141)

Method 3540C – Batch 330856, 8141. The samples associated with this batch had the parent of a MS/MSD pair burn up during the extraction process. Per contract laboratory project manager advisement, the samples will be sent on for analysis, with this accompanying nonconformance memo (NCM). The associated MS/D will be canceled per the contract laboratory project manager.

Method 3546 – Due to the matrix, the sample(s) could not be concentrated to the final method required volume. The RLs are elevated proportionately. The results are accepted.

Method 8151A – Insufficient sample volume was available to perform a MS/MSD associated with 190717.

Method 8151A – Elevated reporting limits are provided for the following sample due to insufficient sample provided for preparation: EB01 (560-62041-10).

Method 3546: The samples required a Florisil clean-up, via EPA Method 3620B, to reduce matrix interferences.

#### **Issues associated with work order 560-62094**

There were no analytical issues associated with work order 560-62094.

**Data Group Numbers (HCP PDS deployed February 4–16, 2016, at Comal and San Marcos Springs):**

**General Comments**

Although some analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation. Passive Diffusion Samplers (PDSs) were deployed from February 4 through 16, 2016. The initial method blank data were accidentally overwritten by the laboratory and not available for inclusion in the laboratory report. However, there was no evidence of system contamination observed in any other quality control sample; the results are accepted.

**Trip Blanks**

There were no detections in the trip blank associated with these samples.

**Equipment Blanks**

Equipment blanks were not applicable due to sampler type.

**Data Group Numbers (HCP PDS deployed April 4–16, 2016, at Comal and San Marcos Springs):**

| Trip Blank 10 <i>00778802</i> | HSM 470 <i>00778801</i>   |

**General Comments**

No analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation. PDSs were deployed from October 10 through 24, 2016. Sampler HSM470 was not analyzed due to evidence of tampering in the field.

**Trip Blanks**

There were no detections in the trip blank associated with these samples.

**Equipment Blanks**

Equipment blanks were not applicable due to sampler type.

**Data Group Numbers (HCP PDS deployed December 1-15, 2016, at Comal and San Marcos Springs):**

|                               |                           |

| FDHCS 440 <i>00778948</i>     | HSM 440 <i>00778954</i>   |
| HCS 460 <i>00778949</i>       | HSM 450 <i>00778955</i>   |
|                               | HSM 460 <i>00778956</i>   |
| Trip Blank 10 <i>00778958</i> | HSM 470 <i>00778957</i>   |

**General Comments**

No analytical issues are noted for the data group, unless otherwise noted in the detailed discussion, the data are considered valid for the purposes of the investigation. PDSs were deployed from December 1 through 15, 2016. Samplers HSM430 and FDHSM430 were in contact with sediment during the deployment and were not analyzed. The duplicate sorber in sampler HSM440 was analyzed as field duplicate to replace FDHSM430.

**Trip Blanks**

There were no detections in the trip blank associated with these samples.

**Equipment Blanks**

Equipment blanks were not applicable due to sampler type.

## **Relative Percent Differences between Field Samples and Their Duplicates**

RPD values for parent samples and associated duplicate samples are provided in Table 2 below. In general, the RPD are less than 20% indicating parent and duplicate sample constituent concentrations are similar. Some differences observed in water samples may be the result of concentrations that vary naturally due to stream flow. Because the streams sampled are constantly flowing, constituent concentrations can change or fluctuate during the time period in which multiple sample bottles, which are all part of the same sample, are filled. Although sediment sample cores were collected in close proximity to one another, soil concentrations may vary spatially, which can cause differences between parent and duplicate sample constituent concentrations.

The differences observed do not show wide variations where a parent sample concentration exceeds a regulatory threshold or comparison value and a duplicate does not, or vice versa.

It should be noted that the RPDs between parent and duplicate field samples not only show differences between the parent and duplicate samples but also include differences inherent to laboratory procedures when the two separate samples are analyzed. Therefore, the laboratory RPDs contribute to the parent and field duplicate constituent concentration RPDs.

**Table 2. Relative Percent Differences between Field Samples and Their Duplicates**

| Sample Location      | Date Collected | Analyte                 | Units      | Field Sample | Qualifiers | Duplicate | Qualifiers | RPD     |
|----------------------|----------------|-------------------------|------------|--------------|------------|-----------|------------|---------|
| <b>Surface Water</b> |                |                         |            |              |            |           |            |         |

B - Analyte detected in the laboratory method blank at the quantity listed

H - Sample exceeded hold time

J - Result above the method detection limit but below the reporting limit

Method detection limits or reporting limits were used to calculate RPD for results not detected above these limits.
