MEMORANDUM

TO: Scott Storment, Chad Furl

FROM: Ed Oborny

DATE: December 26, 2018

SUBJECT: **ITEM M NET DISTURBANCE AND INCIDENTAL TAKE
ASSESSMENT FOR 2018 EARIP ITP ANNUAL REPORT**

EXECUTIVE SUMMARY

The EAHCP Incidental Take Permit (ITP) requires a Net Disturbance and Incidental Take assessment to be conducted at the conclusion of each year for incorporation into the ITP Annual Report. Requirement M (1a and 2a) of the ITP specifically addresses minimization and mitigation activities associated with the HCP. This requirement stipulates that over the course of any given year no more than 10% of a covered species occupied habitat can be affected by HCP mitigation and restoration activities. Following quantification of net disturbance specific to these activities, incidental take was calculated for the disturbed areas. However, that is only part of the overall incidental take assessment. Incidental take associated with implementation of all other applicable HCP covered activities was then characterized and quantified to the degree practical. For a more detailed description of methodologies and species specific results please refer to the Item M Net Disturbance (**SECTION 1**) and Incidental Take (**SECTION 2**) assessments of this technical memorandum. As in previous years, all 2018 assessments were performed in accordance with ITP requirements.

Table ES provides an overview of net disturbance percentages and a summary of incidental take for 2018. As shown in Table ES, only the fountain darter in the Comal System had a net disturbance when considering the project footprint for HCP mitigation and restoration activities overlaid on occupied habitat. The net disturbance was approximately 2% of the total occupied habitat for the Fountain Darter in the Comal system. In the San Marcos system, only the Fountain Darter and San Marcos salamander had net disturbances calculated at approximately 5% and less than 1%, respectively, of their total occupied habitat. In summary, the ITP 10% disturbance rule (Item M [a]) was in compliance for 2018.

Table ES also shows the calculated incidental take on the Comal system with respect to the HCP covered species. The calculated value for the Fountain Darter in the Comal system was slightly higher in 2018 than observed during 2017. The primary cause for the increase for the Fountain Darter in the Comal system was lower discharge conditions in 2018 which resulted in larger spring to fall aquatic vegetation (habitat) reductions primarily in the Upper Spring Run section. In 2018, all invertebrate restoration activities occurred on shore resulting in no calculated incidental take for the listed Comal invertebrates. For the San Marcos system, incidental take for the Fountain Darter also went up slightly in 2018 compared to 2017. The slight increase in the San Marcos system was due to a larger footprint for HCP mitigation primarily native aquatic vegetation restoration in 2018 relative to 2017. The Texas wild-rice exclusion zone implemented for 21 days in the summer below Spring Lake dam resulted in the minor amount of incidental take being calculated for the San Marcos salamander.

When examining 2018 results, conditions are in line with those characterized in the Biological Opinion as an average year. As such, we are confident the incidental take numbers summarized in Table ES and documented in this memorandum continue to justify the data sets used and methodologies employed in 2018 relative to performing an incidental take assessment within the context of the Biological Opinion. It is understood that adjustments to data sets and/or methodologies may be employed based on feedback from the USFWS, HCP Science Committee, HCP participants, or others as deemed appropriate by the EARIP.

Table ES. Summary of Impacted Habitat (m²) and Net Disturbance and Incidental Take for HCP Covered Species compared against ITP Maximum Permit Amounts.

| COVERED SPECIES PER SYSTEM | HCP Mitigation / Restoration | | HCP Measures / Drought | Combined Impacted Habitat 2018 TOTAL (m ²) | INCIDENTAL TAKE | | 2018 INCIDENTAL TAKE TOTAL | ITP Maximum Permit Amount | ITP Permit Maximum minus (combined first six years) |
|------------------------------|------------------------------------|---|------------------------------------|--|------------------------------|------------------------|----------------------------|---------------------------|---|
| | IMPACTED HABITAT (m ²) | NET Disturbance % OF TOTAL Occupied Habitat | IMPACTED HABITAT (m ²) | | HCP Mitigation / Restoration | HCP Measures / Drought | | | |
| COMAL SYSTEM | | | | | | | | | |
| Fountain Darter | 1,599 | 1.5% | 3,356 | 4,955 | 2,399 | 5,034 | 7,432 | 797,000 | 736,334 |
| Comal Springs Riffle Beetle | 0 | 0% | 0 | 0 | 0 | 0 | 0 | 11,179 | 8,887 |
| Comal Springs Dryopid Beetle | 0 | 0% | 0 | 0 | 0 | 0 | 0 | 1,543 | 1,527 |
| Peck's Cave Amphipod | 0 | 0% | 0 | 0 | 0 | 0 | 0 | 18,224 | 18,057 |
| SAN MARCOS SYSTEM | | | | | | | | | |
| Fountain Darter | 4,763 | 5.0% | 3,188 | 7,951 | 7,145 | 4,783 | 11,927 | 549,129 | 474,024 |
| San Marcos Salamander | 15 | < 1% | 0 | 15 | 45 | 0 | 45 | 263,857 | 261,183 |
| Texas Blind Salamander | 0 | 0% | 0 | 0 | 0 | 0 | 0 | 10 | 10 |
| Comal Springs Riffle Beetle | 0 | 0% | 0 | 0 | 0 | 0 | 0 | n/a | n/a |
| Comal Springs Dryopid Beetle | 0 | 0% | 0 | 0 | 0 | 0 | 0 | n/a | n/a |

SECTION 1: ITEM M NET DISTURBANCE ASSESSMENT

Requirement M (1a and 2a) of EAA’s USFWS threatened and endangered species permit (#TE63663A-0) addresses minimization and mitigation activities associated with the HCP. The requirements for Item M (1a and 2a) are stated below directly from the permit:

- 1 Comal Springs, Landa Lake, and the Comal River
 - a. The Permittees will limit disturbance of the (a) substrate, (b) water quality, (c) plants, and (d) animals of the Comal Springs, Landa Lake, and Comal River to no more than 10% of the occupied habitat on an annual basis when implementing HCP measures such as habitat and riparian restoration efforts that may directly or indirectly affect species considered here;
- 2 San Marcos Springs, Spring Lake, and the San Marcos River
 - a. The Permittees will limit disturbance of the (a) substrate, (b) water quality, (c) plants, and (d) animals of the San Marcos Springs, Spring Lake, and the San Marcos River to no more than 10% of the occupied habitat on an annual basis when implementing HCP measures such as habitat and riparian restoration efforts that may directly or indirectly affect species considered here;

All activities described in this memorandum pertain to the HCP Covered species that are actively authorized (Item H: 1-6) in 2018 for incidental take via EAA’s ITP permit. This includes:

- Fountain Darter
- Comal Springs riffle beetle
- Comal Springs dryopid beetle
- Peck’s Cave amphipod
- Texas Blind salamander
- San Marcos salamander

Although the Texas cave diving beetle, Texas troglobitic water slater, and Comal Spring salamander are listed in the permit, the conditions in the Permit are not active in 2018 as none of these species are presently listed as threatened or endangered with this directly acknowledged (Item H: 7-9) in the permit. Additionally, Item I of the permit acknowledges that only if the San Marcos gambusia is located or found in the study area, will take provisions apply. As this has not occurred in 2018, the San Marcos gambusia is not included in this Item M assessment. Finally, being a plant, Texas wild-rice is not allotted incidental take provisions under this federal permit, so it is not germane to the Item M assessment.

Documentation of baseline habitat conditions: For the six actively covered HCP species (listed above) maps of occupied habitat for the Comal and San Marcos Springs/River systems were prepared in GIS, based on EAA biological monitoring data (BIO-WEST 2002 – 2013a,b; BIO-WEST 2014 - 2019a,b) and other existing sources for the HCP covered species. The full system aquatic vegetation mapping performed in 2018 for both systems (BIO-WEST 2019a,b) was used to update all occupied habitat calculations system-wide for the covered species.

Prior to the original Item M assessment, specific discussions were held with staff from the USFWS Austin Ecological Services (ES) office to establish the appropriate definition and description of “occupied” habitat. Based on those initial and subsequent conversations with USFWS ES, “occupied” habitat is presently defined as 1) areas in the Comal and San Marcos systems where the covered species have been physically collected or visually documented, and 2) aquatic vegetation (including Texas wild-rice) types specific to the Fountain Darter that have been routinely sampled over the past decade through biological monitoring with documented occupancy. Table 1 summarizes the occupied habitat in meters squared (m²) for each of the covered species pertinent to the Item M assessment with associated figures presented in Appendix A.

As per the ITP and USFWS Austin ES guidance, the 2018 assessment is representative of conditions for calendar year 2018 including any mitigation / restoration measures that resulted in a change in occupied habitat for any of the covered species.

Comal System

The Fountain Darter has been extensively sampled throughout the Comal system via the long-term biological monitoring program conducted by EAA. Drop netting has occurred in dominant aquatic vegetation types within representative sampling reaches for over eighteen years. On a broader scale, dip netting for Fountain Darters has occurred throughout the Comal system over time. Finally, sampling via other collection techniques, seining, snorkel, and SCUBA have been conducted in the Comal system as well. For the Fountain Darter Item M assessment (represented in Table 1 and Appendix A), only known collection locations and aquatic vegetation that has been routinely sampled and documented as supporting darters throughout the system were counted. Although, Fountain Darters have been physically collected as well as visually documented on bare substrate, this is not common in the Comal system. As such, bare substrate was not counted as occupied habitat for the Fountain Darter in the Comal system.

Although not as extensive as for the Fountain Darter, routine sampling for the Comal Springs riffle beetle has also occurred over the years. It is noted that only surface habitat area was calculated for this assessment, as the extent of subsurface habitat utilization by this species is presently unknown. Appendix A shows the documented occupied habitat for the Comal Springs riffle beetle in the Comal System with the quantification of area presented in Table 1. As described in the HCP, both the Peck's cave amphipod and Comal Springs dryopid beetle are subterranean species. Peck's cave amphipods are frequently found at the surface primarily in areas that Comal Springs riffle beetles are collected, whereas the Comal Springs dryopid beetle is less commonly found. As it is presumed that these subterranean invertebrates are not suited for survival in surface conditions, this analysis continues to quantify 0.5 m² around the orifices that these species have been collected in the Comal system. Appendix A shows documented occupied habitat for the Peck's Cave amphipod and Comal Springs dryopid beetle, respectively, throughout the Comal System with the quantification of surface habitat area presented in Table 1.

TABLE 1. COVERED SPECIES OCCUPIED HABITAT (Figures depicting occupied habitat included in Appendix A)

| ITEM M - SPECIES | OCCUPIED HABITAT (m ²) | NOTES AND ASSUMPTIONS |
|-----------------------------------|------------------------------------|---|
| COMAL SPRINGS / RIVER | | |
| Fountain Darter | 106,399 | Based on collections and known occurrence in aquatic vegetation types sampled over the course of the HCP biological monitoring. Sampling included drop netting, dip netting, snorkel, SCUBA, and seining throughout the Comal system. Although Fountain Darters have been collected on bare substrate on occasion, no bare areas were included in this assessment. |
| Comal Springs Riffle Beetle | 1,680 | Based on collection of individuals via cotton lure, drift net, or quadrat sampling over the years. An area of 1 m ² around each collection point was included but did not include any overlap between collection points. |
| Peck's Cave Amphipod | 1,640 | This species is considered subterranean and thus subsurface habitat is the more appropriate calculation. The total area of subsurface habitat for this species is presently unknown. Surface habitat was based on collection of individuals via cotton lure and drift net sampling. An area of 0.5 m ² around each collection point was included but did not include any overlap between collection points. |
| Comal Springs Dryopid Beetle | 362 | This species is considered subterranean and thus subsurface habitat is the more appropriate calculation. The total area of subsurface habitat for this species is presently unknown. Surface habitat was based on collection of individuals via cotton lure and drift net sampling. An area of 0.5 m ² around each collection point was included but did not include any overlap between collection points. |
| SAN MARCOS SPRINGS / RIVER | | |
| Fountain Darter | 95,413 | Based on collections and known occurrence in aquatic vegetation types (including Texas wild-rice) sampled over the course of HCP biological monitoring. Sampling included drop netting, dip netting, snorkel, SCUBA, and seining throughout the San Marcos system. Although Fountain Darters have been collected on bare substrate in the river on occasion, no bare river areas were included in this baseline assessment. In contrast, bare substrate areas in Spring Lake were included for this assessment as Fountain Darters have frequently been observed inhabiting these areas within Spring Lake. Finally, although Fountain Darters have been collected further upstream in the slough arm of Spring Lake, those collections are considered seasonal at this time and thus were not included in the overall area calculated. |
| San Marcos Salamander | 2,520 | Based on observation or collection of individuals via snorkel / SCUBA over the course of HCP biological monitoring. Also, based on collections conducted by the USFWS San Marcos Aquatic Resources Center. |
| Texas Blind Salamander | n/a | This species is considered subterranean and thus subsurface habitat is the appropriate calculation. As such, no surface habitat was calculated as "occupied habitat" for this species. |
| Comal Springs Riffle Beetle | 11 | Based on collection of individuals via cotton lure and drift net sampling. An area of 1 m ² around each collection point was included but did not include any overlap between collection points. |
| Comal Springs Dryopid Beetle | 0.5 | This species is considered subterranean and thus subsurface habitat is the more appropriate calculation. The total area of subsurface habitat for this species is presently unknown. Surface habitat was based on collection of individuals via drift net sampling. An area of 0.5 m ² around each collection point was included but did not include any overlap between collection points. |

San Marcos System

The Fountain Darter has been extensively sampled throughout the San Marcos system via the long-term biological monitoring program conducted by EAA as well as activities conducted by Texas State University over the years. For EAA biological monitoring, drop netting has occurred in dominant aquatic vegetation types within representative sampling reaches for nearly two decades. On a broader scale, dip netting for Fountain Darters has occurred throughout the San Marcos system relative to EAA biological monitoring. Finally, sampling via other collection techniques, seining, snorkel, and SCUBA have been conducted in the San Marcos system over time by many researchers. For the Fountain Darter Item M assessment, only known collection locations and aquatic vegetation (including Texas wild-rice) that has been routinely sampled with documented occupancy throughout the system were counted.

Similar to the Comal system, although Fountain Darters have been physically collected and visually documented on bare substrate in the San Marcos River, this is not a common occurrence in the river. As such, bare substrate was not counted as occupied habitat for the Fountain Darter in the San Marcos River. In contrast, bare substrate and algae areas in Spring Lake were included for this assessment as Fountain Darters have frequently been observed inhabiting these areas within Spring Lake. Finally, although Fountain Darters have been collected further upstream in the slough arm of Spring Lake, those collections are considered seasonal at this time and thus were not included in the overall area calculated. Appendix A shows the documented occupied habitat for the Fountain Darter throughout the San Marcos system with the quantification of area presented in Table 1.

The San Marcos salamander has been routinely sampled over the years by both the EAA biological monitoring program as well as by the USFWS SMARC for refugia collection purposes. The known collection locations and occupied habitat are depicted in Appendix A and quantified in Table 1. As documented in the HCP, the Texas blind salamander is an aquifer/cave dwelling species. Unlike the subterranean Comal invertebrates which can be found in and around orifices in surface habitat at times, blind salamanders are collected as they are expelled from the aquifer. As such, there is no surface habitat designated for the Texas blind salamander as footnoted in Table 1. Known collection areas are depicted in Appendix A for later use in the net disturbance assessment.

Although not as extensive as in the Comal systems, sampling for the Comal Springs riffle beetle and Comal Springs dryopid beetle has occurred in the San Marcos system. Similar to the Comal system, the determination was made to include a 1 m² and 0.5 m² area surrounding each known collection location of Comal Springs riffle beetles and dryopid beetles, respectively, in the San Marcos system. This aided in the quantification of overall surface area of occupied habitat for the 2018 assessment. It is noted that only surface habitat area was calculated for this assessment, as the extent of subsurface habitat utilization by these species is presently unknown. Appendix A shows the occupied habitat for the Comal Springs riffle beetle and Comal Springs dryopid beetle, respectively in the San Marcos system with the quantification of area presented in Table 1.

Documentation of HCP mitigation areal extent per project: Descriptions of the HCP minimization and mitigation measures for the City of New Braunfels, City of San Marcos, and Texas State University are presented in the ITP Annual Report and will not be duplicated in this memorandum.

Item M of the ITP requires an assessment of the direct HCP mitigation and restoration activities conducted each year. The direct HCP mitigation and restoration activities relative to Item M are listed below for the City of New Braunfels, City of San Marcos and Texas State University.

- City of New Braunfels (projects derived from Item 2f in permit)
 - Flow-split management
 - Restoration and maintenance of native aquatic vegetation (Old Channel and Landa Lake)
 - Decaying vegetation removal
 - Aeration and water quality sonde in Landa Lake
 - Gill parasite
 - Riparian restoration and bank stabilization
 - Riffle beetle restoration
 - Non-native species removal
 - Sediment Island removal
- City of San Marcos and Texas State University (projects derived from Item 3d and the second 4e in permit)
 - Enhancement and restoration of Texas wild-rice
 - Management of recreation specific to State Scientific Areas (only)
 - Non-native species removal
 - Restoration and maintenance of native aquatic vegetation
 - Sediment removal
 - Access Points and Bank Stabilization
 - Riparian restoration

For 2018 activities, pertinent to these projects, the areal extent of the project footprint has been quantified in Table 2 and depicted in subsequent figures per project. The project footprints were then overlaid on the occupied habitat maps in GIS and calculations of “Impact” area were performed. The results for each project and covered species are presented in Table 2.

Comal System

The **Old Channel bank stabilization** project construction was completed during 2016 and thus no calculations were included in the 2018 evaluation for that finished project. Similarly, the **Flow-split management** project was completed in spring 2014 and involved portions of Landa Lake and the Old Channel. Activities conducted in 2018 involved routine operation and maintenance that did not extend out beyond the existing renovated structure. As such, there was no additional footprint for this project in 2018.

The **restoration and maintenance of native aquatic vegetation** project involved restoration activities in the Comal system as shown in Figure 1. These activities included the removal of non-native aquatic vegetation and subsequent restoration of native aquatic vegetation. The 2018 project footprint for native vegetation restoration activities are quantified in Table 2. Additionally, the MUPPT nursery area used to propagate native aquatic vegetation for restoration activities is also considered part of the project footprint (Figure 1). As noted in Table 2, the project footprint of the Native Aquatic Vegetation restoration effort in the Comal system encompassed 2,455 m² which overlapped with 1,567 m² of occupied Fountain Darter habitat. There was not any overlap with occupied habitat for the endangered Comal invertebrates. Although not quantified for this assessment, disturbance from foot traffic to and from these locations and from slightly elevated turbidity during non-native vegetation removal did temporarily occur.

TABLE 2. Mitigation and Restoration Project Areas and Calculated Impact Area per Covered Species in 2018

| HCP ACTIVITY | Project Footprint Area (m²) | “Impact Area” Overlap with Occupied Habitat for Covered Species (m²) | | | | | |
|---|-----------------------------|--|-----------------------------|------------------------------|----------------------|-----------------------|------------------------|
| | | Fountain Darter | Comal Springs riffle beetle | Comal Springs dryopid beetle | Peck’s Cave amphipod | San Marcos salamander | Texas blind salamander |
| CITY OF NEW BRAUNFELS | | | | | | | |
| Flow-split management | -- | -- | -- | -- | -- | | |
| Restoration and maintenance of native aquatic vegetation | 2,455 | 1,567 | 0 | 0 | 0 | | |
| Decaying vegetation removal | A | -- | -- | -- | -- | | |
| Aeration program | Discontinued in 2018 | | | | | | |
| Gill parasite | 12 | 12 | 0 | 0 | 0 | | |
| Riparian restoration | 9,063 | -- | -- | -- | -- | | |
| Bank Stabilization | Completed in 2016 | | | | | | |
| Riffle beetle restoration | 834 | 0 | 0 | 0 | 0 | | |
| Non-native animal species removal | 33 | 20 | 0 | 0 | 0 | | |
| Sediment Island removal | Completed in 2013 | | | | | | |
| TOTAL | 12,397 | 1,599 | 0 | 0 | 0 | | |
| CITY OF SAN MARCOS / TEXAS STATE UNIVERSITY | | | | | | | |
| Enhancement and restoration of Texas wild-rice | B | -- | -- | -- | | -- | -- |
| Management of recreation specific to Exclusion zones (only) | 2,856 | 154 | -- | -- | | 15 | -- |
| Non-native animal species removal | A | -- | -- | -- | | -- | -- |
| Restoration and maintenance of native aquatic vegetation | 6,295 | 4,609 | 0 | 0 | | 0 | 0 |
| Sediment removal | C | -- | -- | -- | | -- | -- |
| Access Points and Bank Stabilization | C | -- | -- | -- | | 0 | 0 |
| Riparian restoration | 59,380 | 0 | 0 | 0 | | 0 | 0 |
| TOTAL | 68,531 | 4,763 | 0 | 0 | | 15 | 0 |

A Throughout system – described in qualitative impacts discussion

B Project footprint is accounted for in Native Aquatic Vegetation restoration project

C No independent activities conducted in 2018.

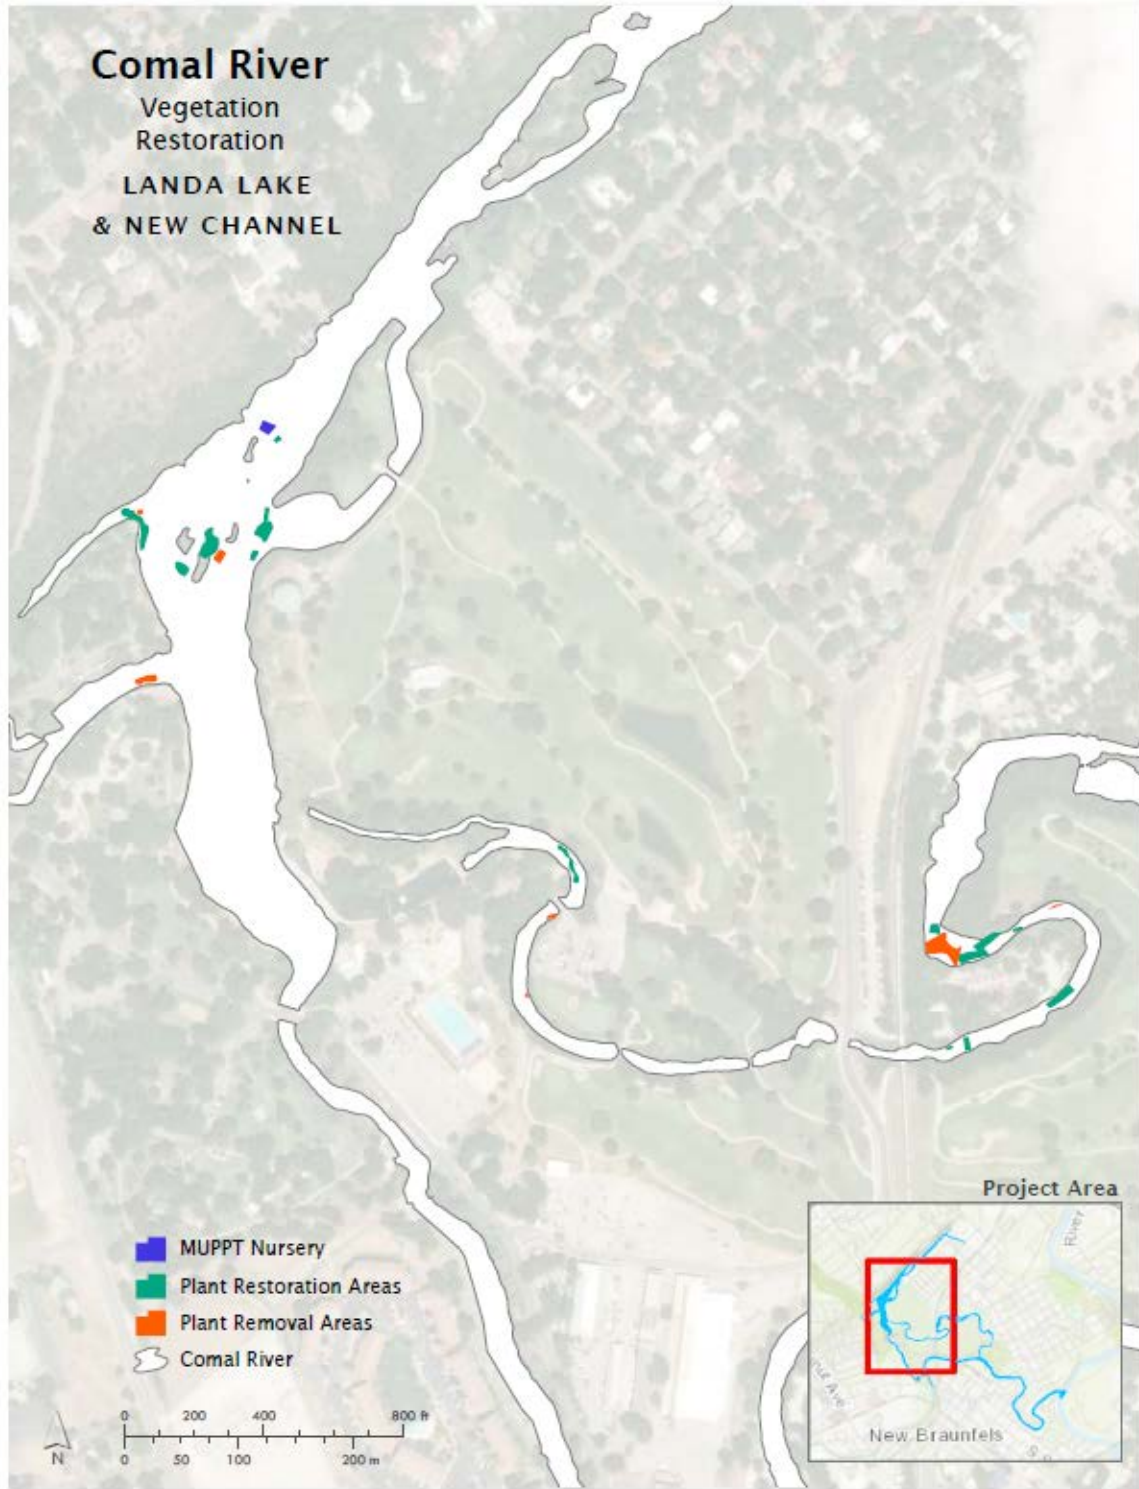

Figure 1. Restoration and Maintenance of Native Aquatic Vegetation project in the Comal system.

The **Sediment Island removal** project in the Old Channel was completed in 2013 and thus no calculations were included in the 2018 evaluation for that finished project. Activities associated with supplemental planting of native aquatic vegetation in that section of the Old Channel were covered under the native aquatic restoration project.

As presented in previous years, there is no project footprint map for the **Decaying Vegetation Removal** project as it was conducted throughout the main portion of Landa Lake and the New Channel on an as needed basis when floating mats of aquatic vegetation had built up. As such, no quantified area of impact was designated in 2018 for this activity. Temporary disturbance resulting from occasional foot traffic within Fountain Darter occupied habitat did occur as well as slightly elevated turbidity downstream from immediate work zone.

The **Aeration** project in Landa Lake was discontinued in 2018 and thus no calculations were included in the 2018 evaluation.

The **Gill parasite** project involved snail density quadrat sampling that disturbed the entire substrate in twelve 0.25-meter quadrat locations (three each in the Upper Spring Run, Landa Lake, Old Channel and New Channel). A 1-meter area encompassing each smaller quadrat was calculated for the footprint and overlap with occupied habitat and recorded in Table 2. For all Gill Parasite project activities (snail density sampling and water sampling cross sections) temporary disturbance from foot traffic in and around the areas/transects as well as slightly elevated turbidity downstream did occur.

The **Riffle beetle restoration** project involved only on shore activities in 2018 (Figure 2). The project footprint occurred on the bank adjacent to Spring Run 3 where restoration consisted of planting native vegetation as a buffer between the park sidewalk and the spring run edge.

The **Non-native animal species removal** project involved using fyke nets during each trapping session. Fyke nets are passive traps that have 50-foot leads that guide fish into a 12-foot long by 3-foot wide hoop net. Additionally, five gill nets were used in Landa Lake and a series of nutria traps were deployed along the banks of the Comal system. The footprint of the fyke nets, gill nets and nutria traps is presented in Table 2 along with the overlap of fountain darter occupied habitat. In addition to these activities, biologists snorkeled early in the morning and late in the afternoon (high times of fish activity) in areas of high fish density and speared non-native fish as well as hand picking giant ramshorn snails. Temporary disturbance resulting from limited foot traffic within Fountain Darter occupied habitat and slightly elevated turbidity downstream likely occurred during net placement and retrieval.

A **Riparian restoration** project was continued along the Old Channel of the Comal River in 2018 and involved a project footprint of 9,063 m². The riparian treatment areas are depicted on Figure 3 and quantified in Table 2. Similar to the more established HCP riparian restoration project in the San Marcos system, all activities were conducted on the banks and water's edge and did not overlap with any occupied habitat for the covered species.

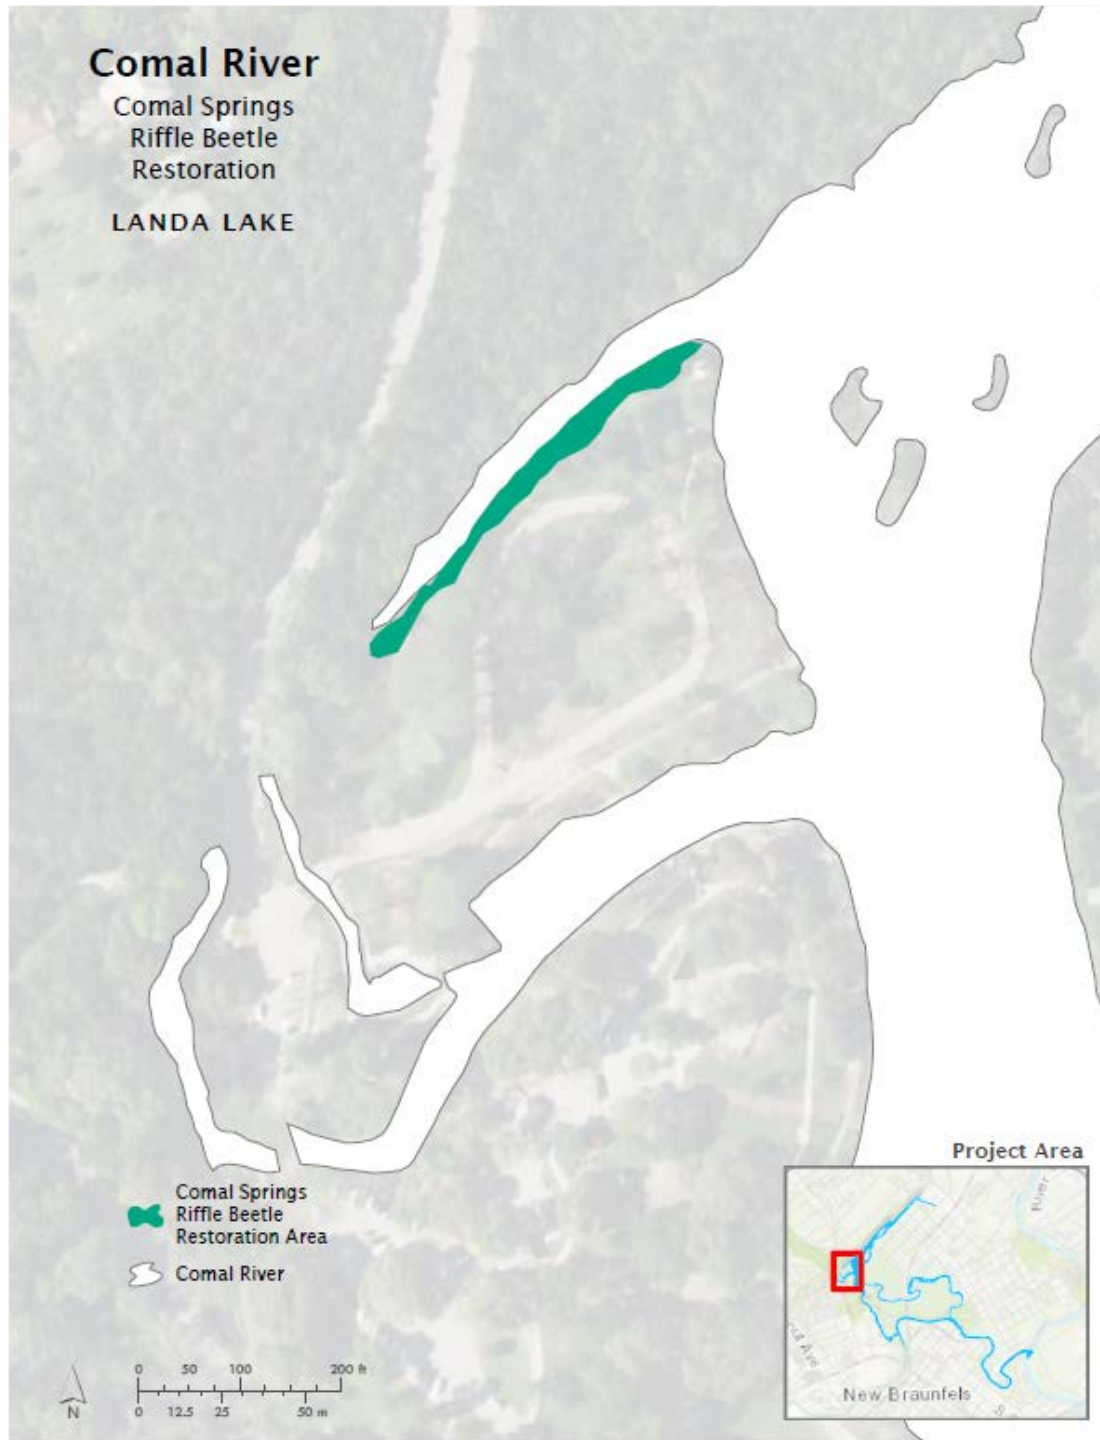

Figure 2. Comal Springs Riffle Beetle Restoration project – Comal System.

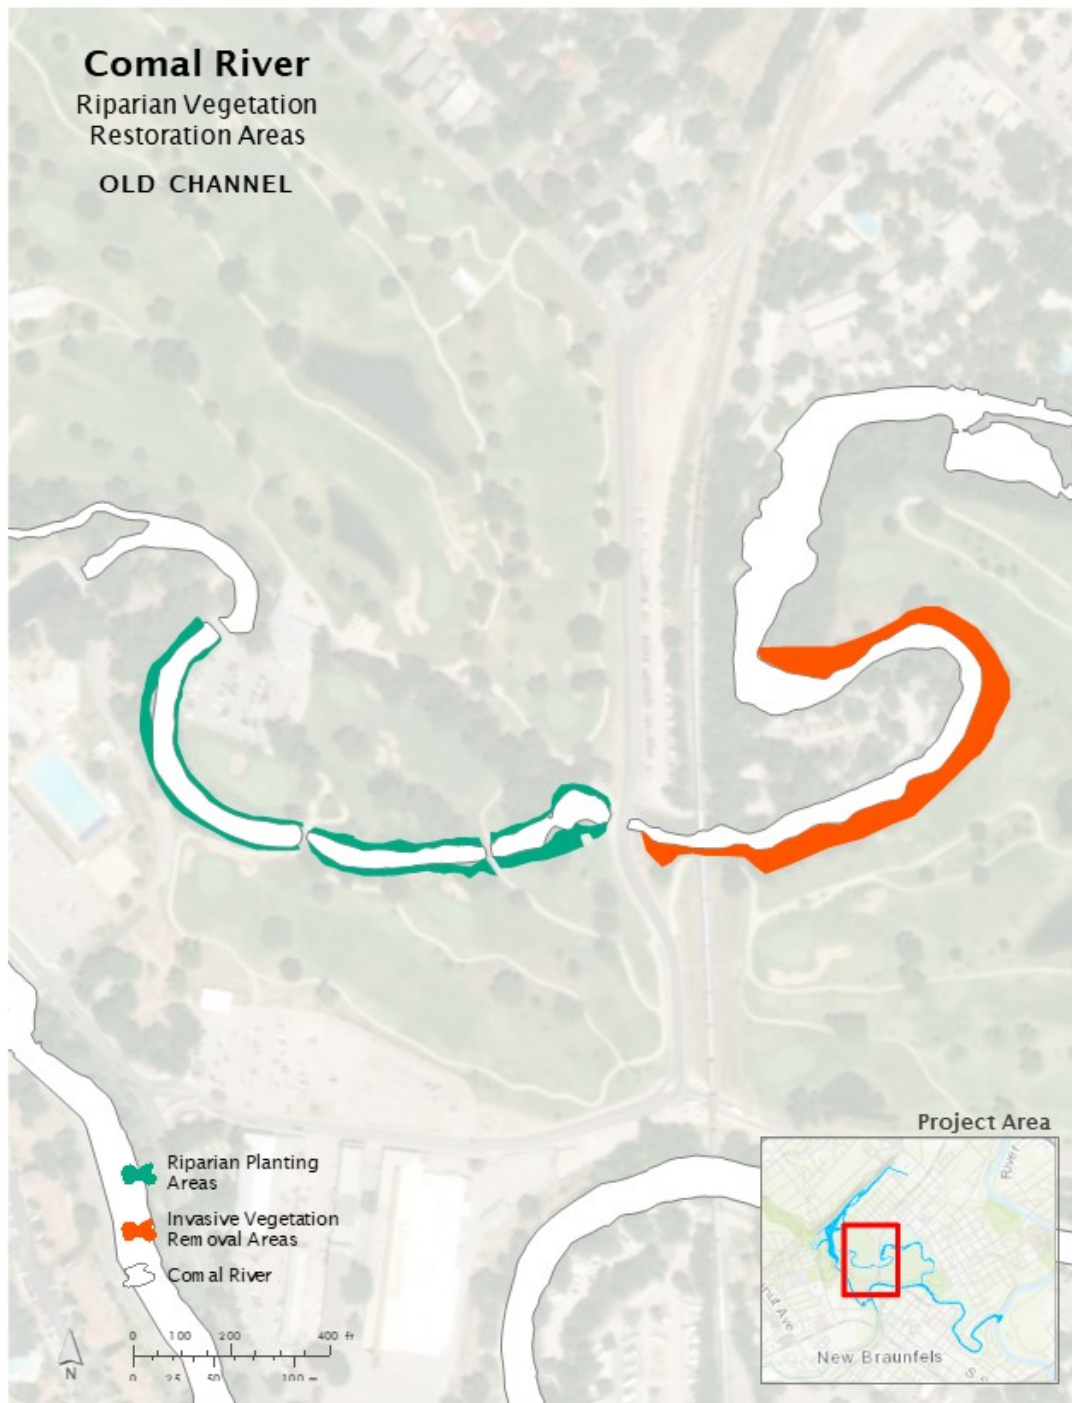

Figure 3. 2018 Riparian Vegetation Restoration Areas – Old Channel - Comal River.

San Marcos System

The **Enhancement and restoration of Texas wild-rice** and **Restoration and maintenance of native aquatic vegetation** project areas are depicted in Figure 4. As described in the ITP Annual Report, select non-native aquatic vegetation was removed from these areas allowing native vegetation (including Texas wild-rice) to expand over 2018. Native aquatic vegetation was also planted in cleared areas within these sections to promote restoration activities where practical and appropriate. As evident in Table 2, the working project area supports a footprint of 6,295 m² of which 4,609 m² overlaps with Fountain Darter occupied habitat (Table 2). Although not quantified for this assessment, disturbance from foot traffic to and from these locations and from slightly elevated turbidity during non-native vegetation and sediment island removal did temporarily occur.

There were four **Exclusion zones** incorporated for 21 days in the summer within the State Scientific Areas in 2018 for the management of recreation (Figure 5). These areas included Clear Springs river left; immediately below Sewell Park river right; directly across from the Veramendii access point river left; Bicentennial Park river right. The total footprint of these areas resulted in the protection of approximately 2,856 m². The upstream exclusion zone in the eastern spillway below Spring Lake Dam was strategically placed over Fountain Darter and San Marcos salamander occupied habitat as well as Texas wild-rice. Although this area overlaps each of these covered species occupied habitats, the majority of the project footprint is a net benefit from the exclusion of recreation in these areas. The impact areas listed in Table 2 represent a 0.5 m swath across the upstream and river side perimeter of the exclusion zones to account for the placement of the signs and booms as well as foot traffic to patrol these areas. As such the total disturbance area for the four exclusions zones was 154 m² for the Fountain Darter and 15 m² for the San Marcos salamander which is only impacted by the upper portion of the exclusion zone just below Spring Lake dam. Temporary disturbance of slightly elevated turbidity to downstream areas did result from foot traffic to patrol and maintain these areas.

There is no project footprint map for the **Non-native animal species removal** project as it was conducted throughout Spring Lake and the San Marcos River without permanent or temporary installation of equipment. Most work was conducted via snorkel or SCUBA in areas of high fish density with non-native fish being speared.

There was no new work in 2018 with respect to **Access Points** or **Bank Stabilization** in the San Marcos system and thus no calculations were included in the 2018 evaluation.

The **Riparian restoration** project along the San Marcos River in 2018 involved a project footprint of approximately 59,380 m². The active riparian treatment areas are depicted on Figure 6 and quantified in Table 2. As in years past, the riparian restoration project took place on the banks and water's edge and did not overlap with any occupied habitat for the covered species.

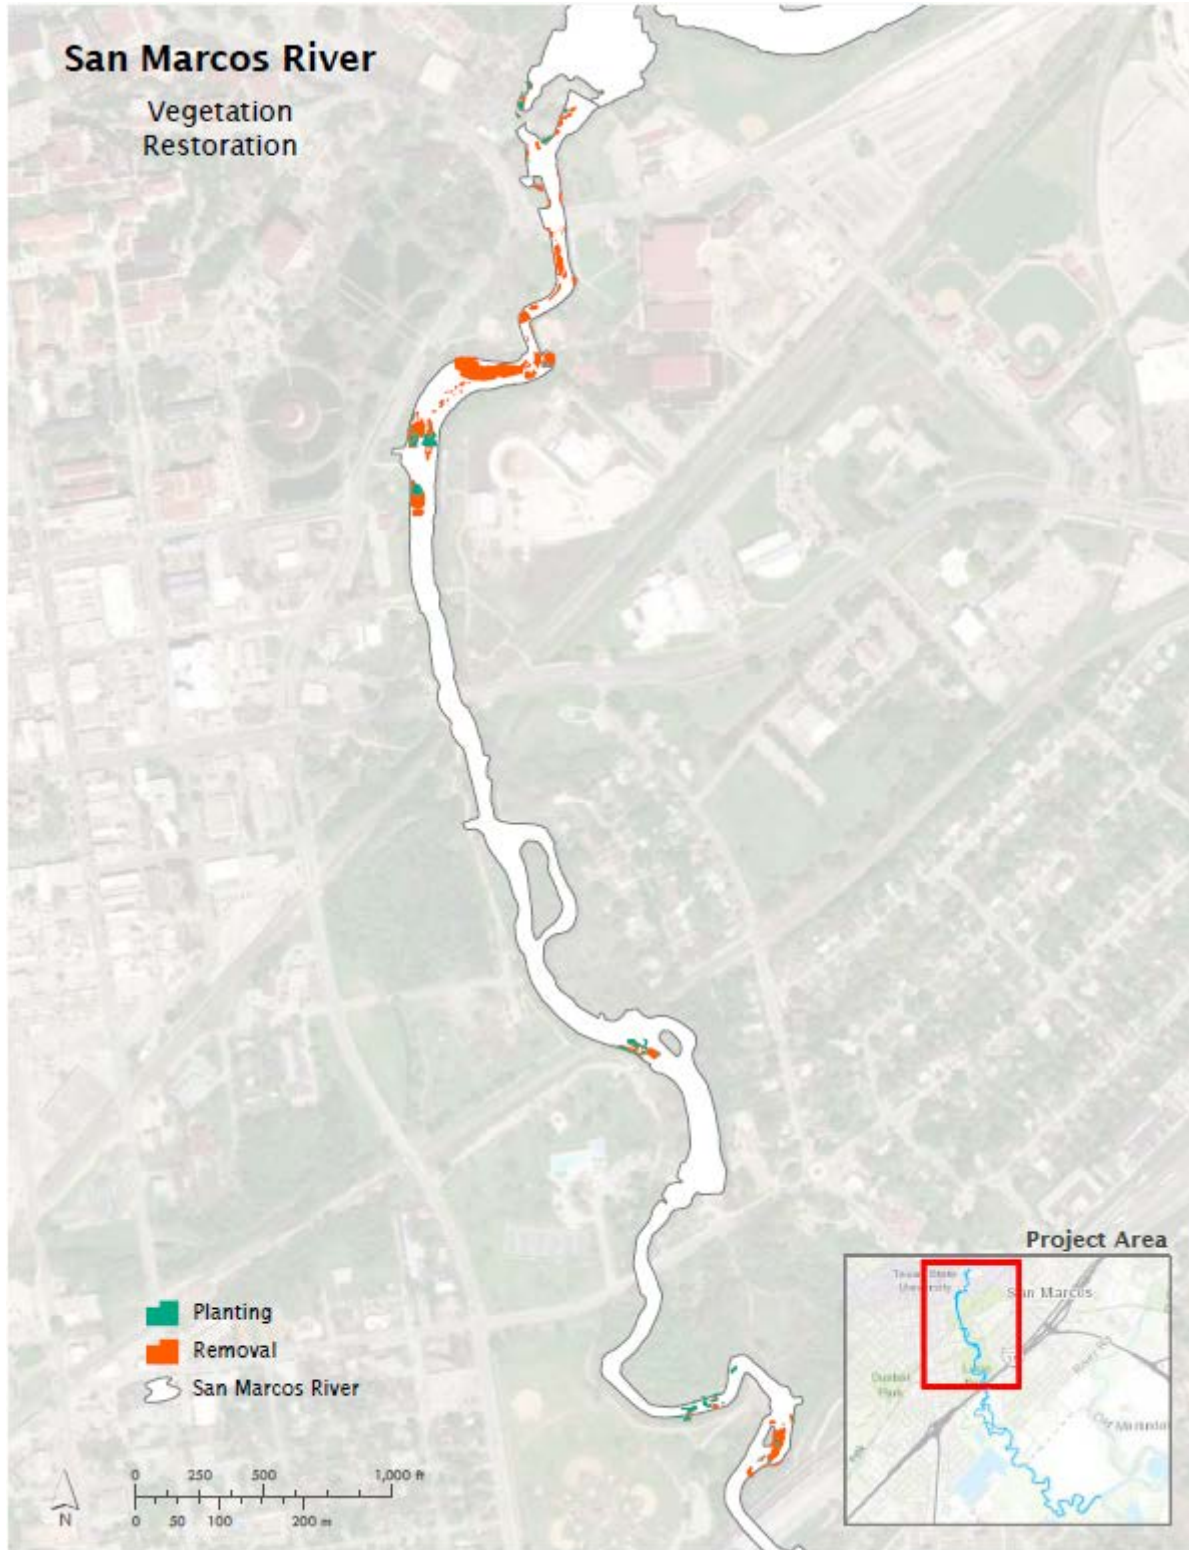

Figure 4. Restoration and Maintenance of Native Aquatic Vegetation and Enhancement of Texas wild-rice projects – San Marcos River.

Figure 5. Four Texas wild-rice Exclusion Zones within State Scientific Area for Recreation control in 2018 – San Marcos River.

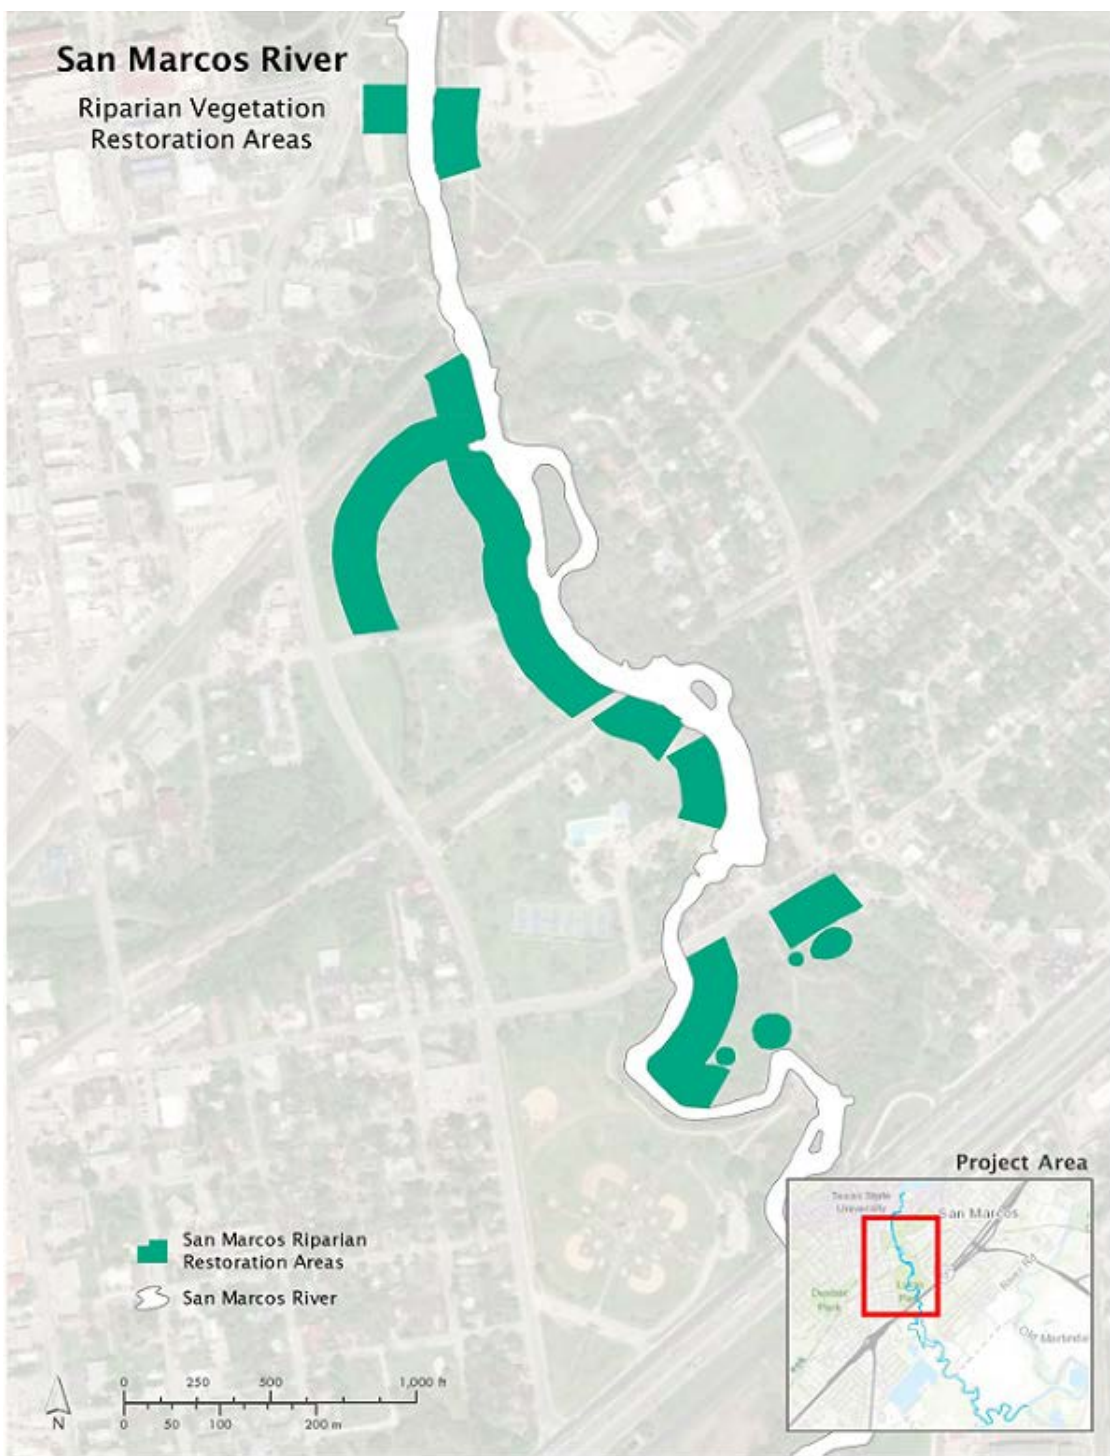

Figure 6. 2018 Riparian Restoration areas – San Marcos River.

Net Disturbance Assessment:

As described above, the baseline maps of occupied habitat versus the HCP project footprint maps were examined to quantify the area of potential effects from mitigation and restoration activities as required in Item M (1a and 2a). This included a system-wide assessment of net disturbance. The focus was on quantifying the direct impacts via areal coverage of activity, but temporary disturbance from slightly elevated turbidity and increased foot traffic were also described. Table 3 shows the Net Disturbance calculation which is simply the sum of all project impact area that is overlaying baseline occupied habitat for a given covered species per system. As shown in Table 3, only the Fountain Darter in the Comal System had a net disturbance when considering the project footprints overlaid on occupied habitat. The Fountain Darter had approximately 2% of its total occupied habitat disturbed (Table 3) in the Comal system.

TABLE 3. Net Disturbance Area and Percentage of Total per Species per System

| COVERED SPECIES | Total Occupied Habitat (m ²) | Net Disturbance | |
|---|---|----------------------------------|------------|
| | | Impact Area (m ²) | % of Total |
| CITY OF NEW BRAUNFELS | | | |
| Fountain Darter | 106,399 | 1,599 | 1.5% |
| Comal Springs riffle beetle | 1,680 | 0 | -- |
| Comal Springs dryopid beetle | 362 ^A | 0 | -- |
| Peck’s Cave amphipod | 1,640 ^A | 0 | -- |
| CITY OF SAN MARCOS / TEXAS STATE UNIVERSITY | | | |
| Fountain Darter | 95,413 | 4,763 | 5.0% |
| San Marcos salamander | 2,520 | 15 | < 1% |
| Texas blind salamander | B | | |
| Comal Springs riffle beetle | 11 | 0 | 0 |
| Comal Springs dryopid beetle | 0.5 ^A | 0 | 0 |

^A Although a minimal amount of surface habitat was documented for the baseline and comparison purposes, this species is subterranean and utilizes subsurface habitat.

^B No surface habitat documented for this species.

In the San Marcos system, both the Fountain Darter and San Marcos salamander had a net disturbance per this assessment. The Fountain Darter had approximately 5% of its total occupied habitat disturbed whereas the San Marcos salamander amount was less than 1%. For the Texas blind salamander, Comal Springs riffle beetle and Comal Springs dryopid beetle, there were no activities conducted in 2018 that directly impacted any of the orifices where collections have routinely been made over the years. As such, no direct impacts to subterranean or aquifer habitat was experienced from 2018 HCP mitigation and restoration measures in the San Marcos system.

In summary, the ITP 10% disturbance rule (Item M [a]) was in compliance for 2018.

SECTION 2 - INCIDENTAL TAKE

All discussions presented in this section relate back to the USFWS Biological and Conference Opinions for the Edwards Aquifer Recovery Implementation Program Habitat Conservation Plan – Permit TE-63663A-0 (Consultation No. 21450-2010-F-0110), hereafter, Biological Opinion. The goal of this section is to characterize and quantify to the degree practical the Incidental Take that occurred in 2018 as a result of implementation of the HCP. This incidental take exercise builds upon the occupied habitat characterization and net disturbance assessment discussed in Section 1 relative to Requirement M (1a and 2a) of EARIP's ITP. As discussed above, the net disturbance assessment specifically addressed mitigation and restoration activities associated with the HCP. However, that net disturbance quantification represents only the baseline component of one aspect of the incidental take assessment. In addition to assigning incidental take to the disturbed areas from HCP mitigation and restoration activities, this assessment characterizes and quantifies to the degree practical the incidental take associated with implementation of all other applicable HCP covered activities. Thus, the two categories carried forward through this section include 1) HCP Mitigation and Restoration and 2) HCP Measures and Drought.

BACKGROUND

To understand the assessment, it is vital to understand what “take” and “incidental take” are. Section 8 of the Biological Opinion describes and defines “Take” as follows, “Take is defined by the Service as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harass is further defined by the Service as an intentional or negligent act or omission which creates the likelihood of injury to a listed species by annoying it to such an extent as to significantly disrupt normal behavioral patterns, which include, but are not limited to, breeding, feeding and sheltering (50 CFS §17.3). Harm is also further defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by impairing behavioral patterns, including breeding, feeding, and sheltering. Incidental take is defined by the Service as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity.” As such and as referenced above, the goal of this assessment is to characterize and quantify Incidental Take to the degree practical.

Specific to the EARIP ITP, an incidental take assessment is relative to Items S and T as described below.

Item S 3. “The Permittees will develop and oversee a monitoring program to identify and assess potential impacts, including incidental take, from Covered Activities and provide a better understanding and knowledge of the species’ life cycles and desirable water quality- and springflow-related habitat requirements of the Covered Species (Section 6.3 of the HCP).”

Item T 3i. “Effects on the Covered Species or Permit Area”

An intensive monitoring program is in place and being performed for the HCP. In fact, the biological monitoring program was instrumental in assessing the effects on the Covered species described in this memorandum.

Item G of EARIP's ITP addresses the covered animal species that are authorized for incidental take. There are 10 animal species with take authorization and 1 plant species for impact assessment only. All activities described in this section pertain to the HCP Covered species that are actively authorized (Item H: 1-6) in 2018 for incidental take via EARIP's ITP. This includes the Fountain Darter, Comal Spring riffle beetle, Comal Spring dryopid beetle, Peck's Cave amphipod, Texas blind salamander, and San Marcos Salamander. Although the Texas cave diving beetle, Texas troglitic water slater, and Comal Spring salamander are listed in the permit, the conditions in the ITP are not active in 2018 as none of these species are presently listed as threatened or endangered with this directly acknowledged (Item H: 7-9) in the ITP. Additionally, Item I of the permit acknowledges that only if the San Marcos gambusia is located or found

in the study area, will take provisions apply. As this has not occurred in 2018, the San Marcos gambusia is not included in this assessment. Finally, being a plant, Texas wild-rice is not allotted incidental take provisions under this federal permit.

HCP Covered Activities

Item L of EARIP's ITP outlines the covered activities under this permit. There are responsibilities associated with all five (EAA, City of New Braunfels, City of San Marcos, Texas State University, and San Antonio Water system) HCP participants. A detailed list and description of these activities are presented in the HCP (EARIP 2011) and thus are only presented in outline form below. All activities outlined are considered included in this assessment to the degree practical and appropriate at this time.

Edwards Aquifer Authority

- a Programs that implement the statutory function of the EAA Act
- b Minimization and Mitigation Activities

City of New Braunfels

- a Recreational activities within the City of New Braunfels's jurisdiction
- b Management of Ecosystems of Comal Springs, Landa Lake, and the Comal River
- c Diversion of water from the Comal River in accordance with State law
- d Maintenance and operation of the spring-fed pool
- e Operation of boats on the Comal River and Landa Lake
- f Minimization and Mitigation Activities
 - Flow split management
 - Native Aquatic vegetation restoration
 - Management of public recreation
 - Decaying vegetation removal and dissolved oxygen management
 - Management of harmful non-native animal species
 - Monitoring and management of gill parasite
 - Prohibition of hazardous materials transport
 - Restoration of native riparian vegetation
 - Reduction of non-native species introduction and live bait prohibition
 - Litter collection and floating vegetation management
 - Management of Golf Course Diversions and operations
 - Impervious cover / water quality protection
 - Removal of sediment

City of San Marcos

- a Recreational activities within the City of San Marcos's jurisdiction
- b Operation of boats on the San Marcos River and Spring Lake
- c Routine, minor repairs of infrastructure and facilities
- d Minimization and Mitigation Activities
 - Enhancement and restoration of Texas wild-rice
 - Management of public recreation
 - Management of aquatic vegetation and litter
 - Prohibition of hazardous materials transport
 - Reduction of non-native species introduction
 - Removal of harmful erosion-related sediment below Sewell Park
 - Designation of permanent access points and bank stabilization
 - Management of non-native plant species
 - Management of harmful non-native and predator species
 - Restoration of native riparian vegetation

Implementation of a City of San Marcos septic system registration and permitting program
Management of potentially contaminated runoff
Implementation of a City of San Marcos household hazardous waste program
Implementation of water quality protection and an impervious cover limitation program

Texas State University

- a Recreational activities within the University's jurisdiction
- b Educational activities
- c Management of the ecosystems of the San Marcos River and Springs
- d Permitted diversion of water from Spring Lake and the San Marcos River
- e Operation and maintenance of the University golf course and grounds
- f Minimization and Mitigation Activities
 - Enhancement and restoration of Texas wild-rice
 - Management of public recreation
 - Management of aquatic vegetation from Sewell Park to City Park
 - Removal of harmful erosion-related sediment in Spring Lake and from Spring Lake Dam
 - Management of surface water diversion
 - Restoration of native riparian vegetation
 - Removal of harmful erosion-related sand bar in Sessom's Creek
 - Management of research programs in Spring Lake
 - Reduction of non-native species introduction
 - Management of non-native plant species
 - Management of harmful non-native and predator species

San Antonio Water System

- a Pumping from the Edwards Aquifer and for use and operation of the SAWS ASR
- b Minimization and Mitigation Activities
 - Use of SAWS ASR for Springflow protection
 - Phase II Expanded Use of the SAWS ASR

The Biological Opinion summarizes the covered activities into two main types, 1) flow protection and springflow management measures including changes to EAA CPM pumping restrictions, the management and use of the SAWS ASR to support springflows, implementation of the VISPO program or equivalent necessary measures, and reductions of surface water diversions and 2) other covered activities including but not limited to sediment removal, water-based recreation, non-native species management, operation and maintenance of flow management infrastructure, and other considered activities. The Biological Opinion acknowledged that impacts from flow protection and springflow management measures would not be anticipated during average years, while impact from all other HCP activities could occur in all years.

2018 INCIDENTAL TAKE ASSESSMENT

The 2018 incidental take assessment described in this section was conducted in the same manner as previous years by first being broken down into two distinct categories to be carried forward in the assessment. The first category involves HCP mitigation and restoration activities specifically accomplished within the two springs ecosystems. These projects were the focus of the SECTION 1 - Item M net disturbance assessment. The second category pertains to covered activities that are foundational components (flow protection and springflow management measures) and on-going activities (water borne recreation, water diversions, existing water management infrastructure and operation, etc.). Each category is assessed independently below and then summed to represent the total amount of incidental take observed in 2018. Although

calculated independently, a foundational first step to both assessments was the documentation of “occupied” habitat for the covered species as described in SECTION 1 (Table 1).

As described in SECTION 1, the baseline maps of occupied habitat versus the HCP project footprint maps were examined to quantify the area of potential effects from mitigation and restoration activities in Item M (1a and 2a) (Table 2). The focus was on quantifying the direct impacts (removal of non-native vegetation, removal of sediment, permanent placement of equipment, etc.) via areal coverage of activity, but temporary disturbance from slightly elevated turbidity and increased foot traffic were also qualitatively described. Table 3 in SECTION 1 shows the net disturbance calculation which is the sum of all project impact area that is overlaying baseline occupied habitat for a given covered species per system.

HCP MEASURES and DROUGHT: Documentation of impacted habitat for all other applicable HCP Covered Activities

In addition to characterizing the impacted habitat from direct HCP mitigation measures and restoration activities as described SECTION 1, this assessment also addresses impacted habitat from all other applicable HCP Covered activities. As previously referenced, these other activities will be referred to as “HCP measures and drought” throughout the remainder of this assessment. As with the net disturbance assessment and Biological Opinion, this evaluation uses impacted habitat as the foundation for subsequent analysis. A discussion for each covered species is presented below.

Fountain Darter:

A wealth of aquatic vegetation data over time is available per the long-term biological monitoring that has been conducted by EAA since 2000. The health and abundance of the Fountain Darter is strongly tied to the quantity and quality of aquatic vegetation present in both the San Marcos and Comal systems. As such, the determination was made to use the current aquatic vegetation data to characterize and quantify the amount of impacted habitat that occurred in 2018 relative to HCP measures and drought. Spring and fall sampling efforts for aquatic vegetation have been conducted in seven sample reaches (4 in Comal and 3 in San Marcos) since 2002. The sample reaches for the Comal System are shown in Figure 7 and include the Upper Spring Run sample reach, Landa Lake sample reach, New Channel sample reach, and Old Channel sample reach. The sample reaches for the San Marcos system are shown in Figure 8 and include the Spring Lake Dam sample reach, City Park sample reach, and the I35 sample reach. For both systems (Figures 7 and 8), the corresponding river section that corresponds to each sample reach is also shown.

The first step in this analysis was to compile all the spring and fall coverage of individual aquatic vegetation species from each of the seven sample reaches over time. All rooted aquatic vegetation per reach per event was combined into a total aquatic vegetation amount. Green algae were not included in the assessment because it is not rooted, is poor quality Fountain Darter habitat, and has a high level of variability from year to year. Although bryophytes are not rooted, they were included in the assessment for the slow-moving sample reaches of Landa Lake and the Upper Spring Run in the Comal system only. The main river sections that support a defined channel and greater velocities result in highly variable conditions for the non-rooted bryophytes in the New and Old Channels of the Comal River and all three reaches in the San Marcos River. However, in the Landa Lake and Upper Spring Run sample reaches, relationships between bryophytes and total system discharge are apparent, and bryophytes provide high quality Fountain Darter habitat in these reaches.

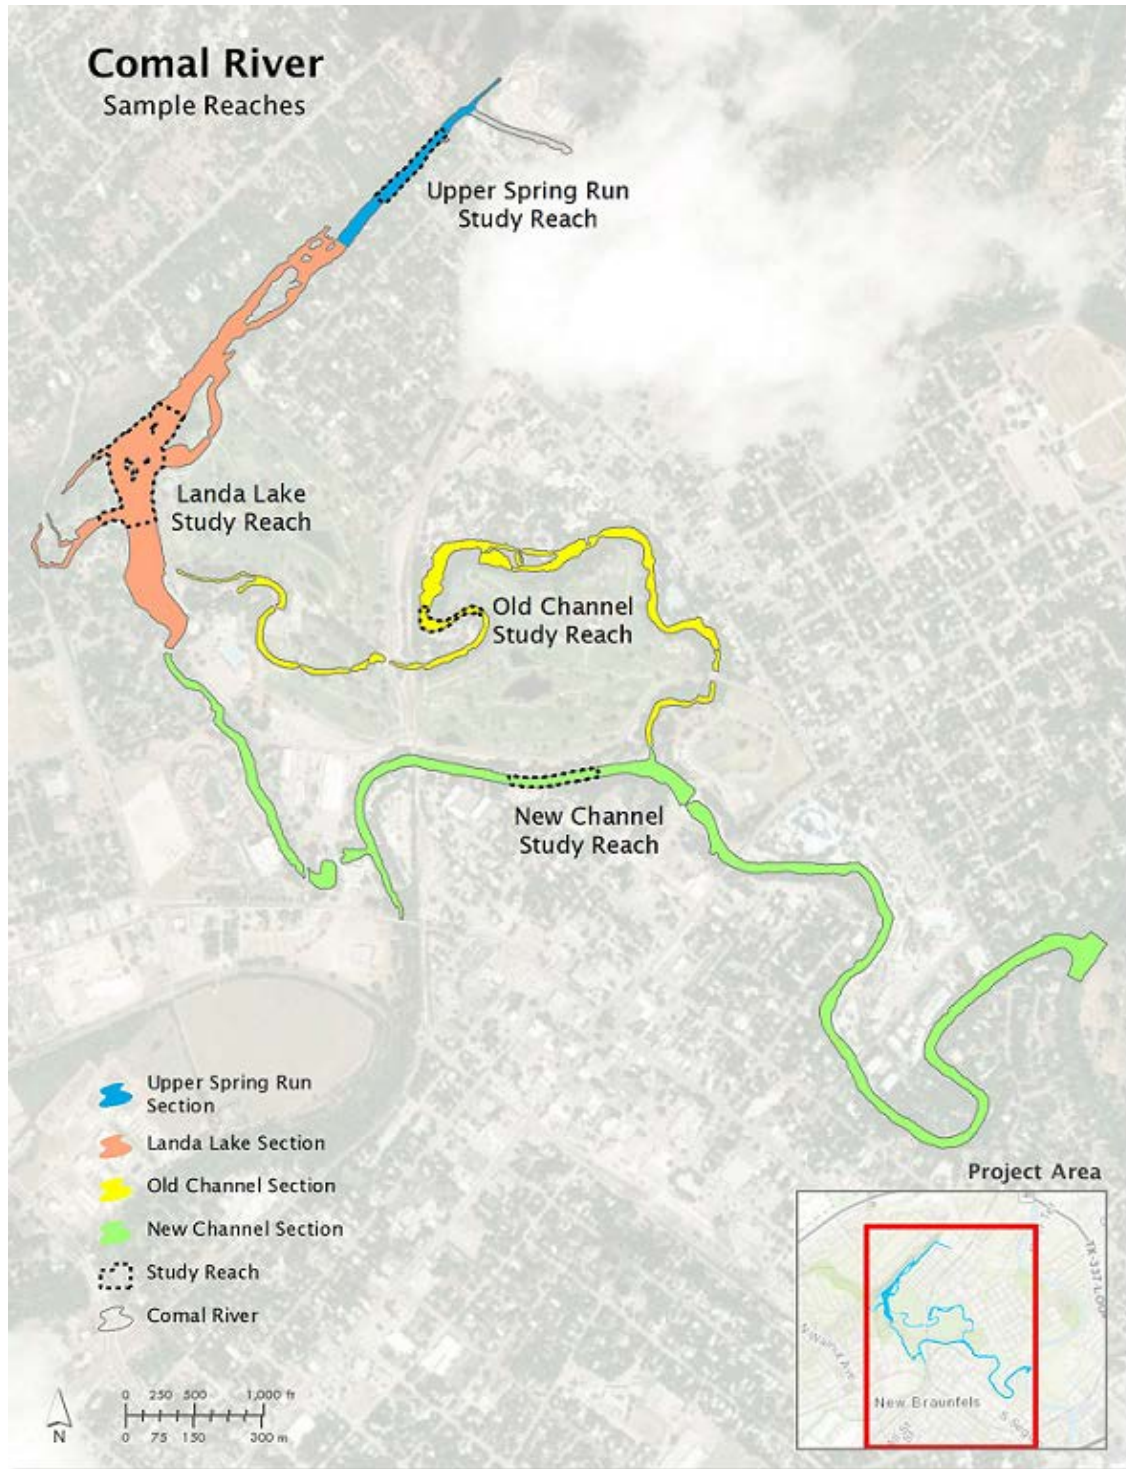

Figure 7. Study Reaches (4) for the Comal System and Corresponding River Section.

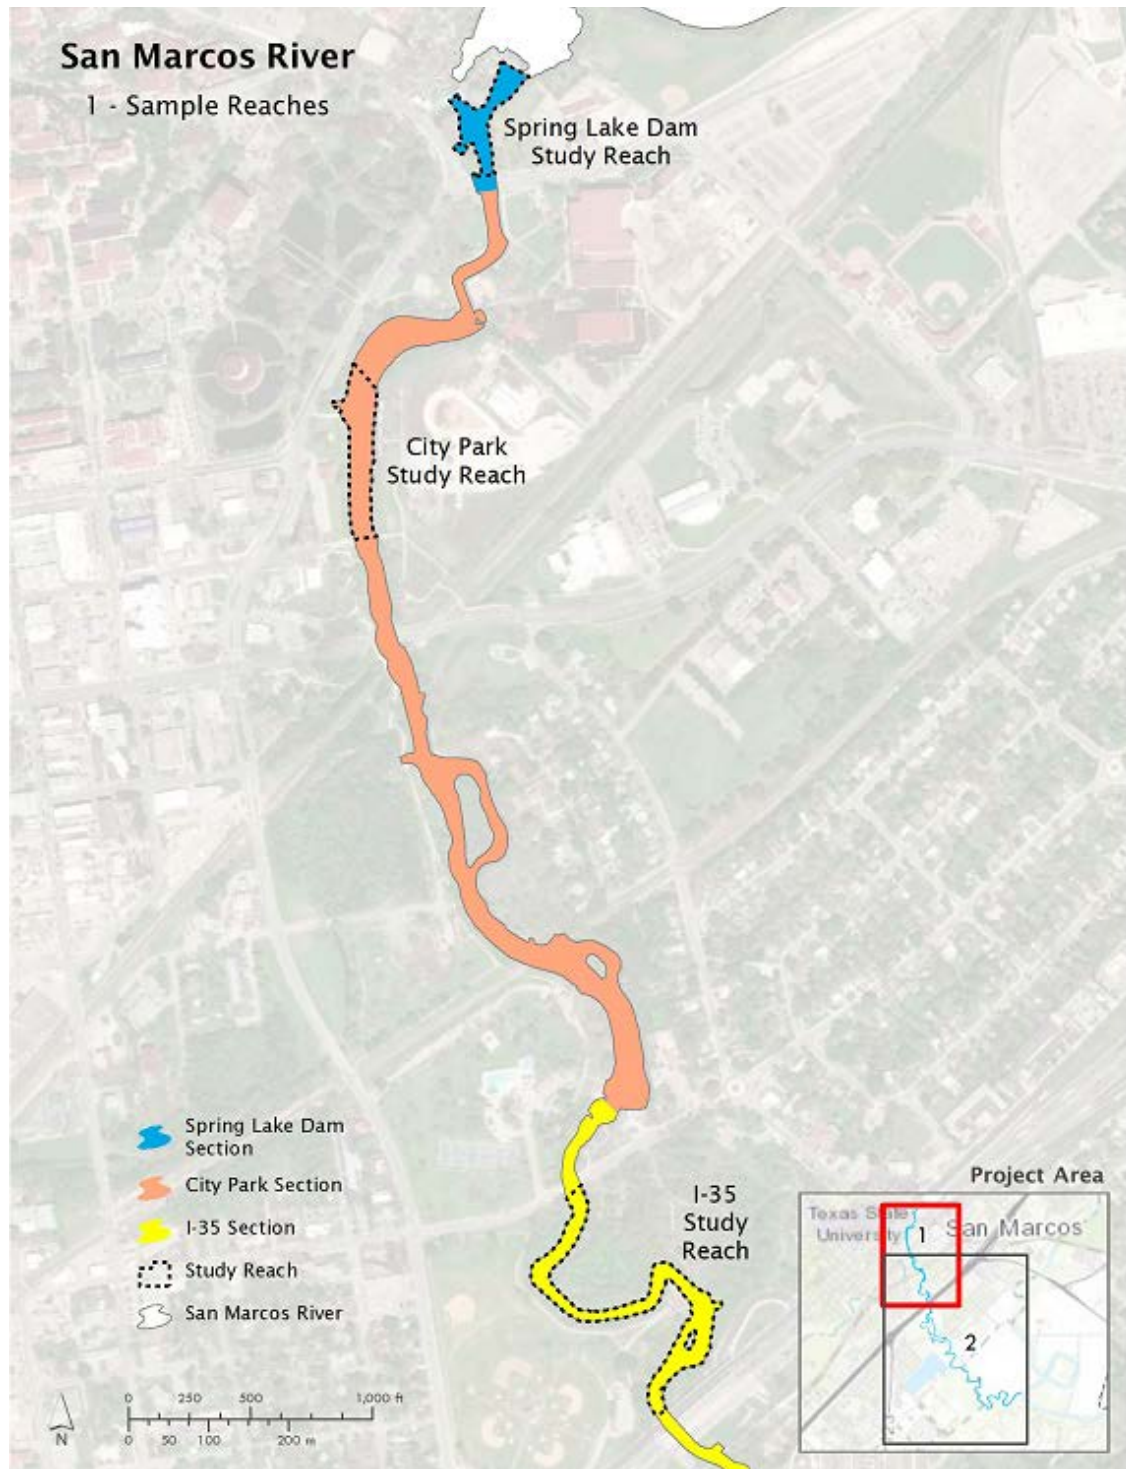

Figure 8. Study Reaches (3) for the San Marcos System and Corresponding River Section.

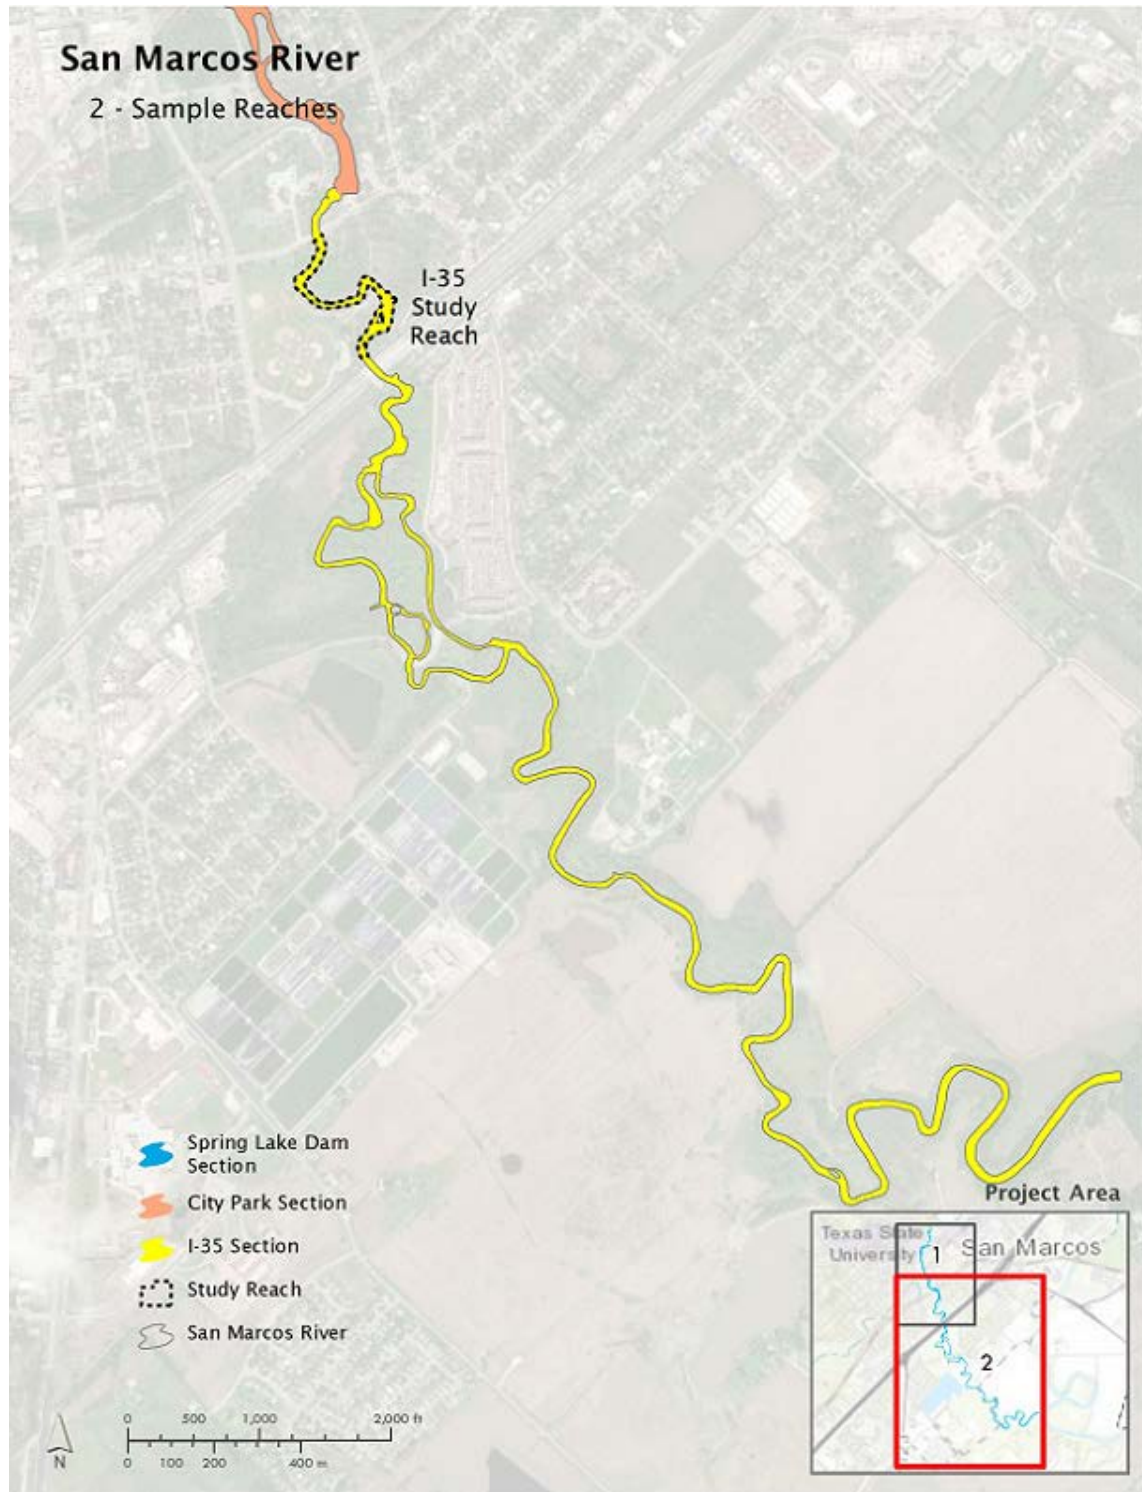

Figure 8 cont. I35 Study Reach and Corresponding Lower River Section in the San Marcos System.

Table 4 shows the total aquatic vegetation (m²) present in each of the four study reaches in the Comal system over time. The color coding in Table 4 relates to “average” years [green], “flood event” years [blue], and “drought” years [orange]. Average years were determined as any year that exhibited over 225 cfs total system discharge throughout the majority of the year. The 225 cfs value was selected as it is the long-term average flow management objective specified in the HCP (EARIP 2011). In addition to being over 225 cfs, an average year for this assessment did not exhibit any flood events during the year or previous fall that substantially altered the aquatic vegetation within a given sample reach. If a flood event occurred in this manner and altered either the spring or fall aquatic vegetation amount, that year was discarded from the analysis. Finally, a drought year was determined as any year that exhibited total system discharge that went below 225 cfs for extended portions of the year. Concurrently, that drought year did not exhibit any flood events within the year that altered the aquatic vegetation in the sample reaches or it was discarded. As evident in Table 4, average and drought years were fairly consistent amongst reaches, but the Upper Spring Run and New Channel sample reaches were affected more frequently from flood-related high flow events. Figure 9 shows the Comal River hydrograph over the biological monitoring program time period with the larger daily average peak flows noted.

Table 4. Total Aquatic Vegetation in the Spring and Fall per reach on the Comal System over time.

| Season | Upper Spring Run Reach | | | Landa Lake Reach | | | Old Channel Reach | | | New Channel Reach | | |

"AVERAGE YEAR" Total System discharge of >225 cfs throughout most of the year

"DROUGHT YEAR" Total System discharge of < 225 cfs discharge for most of the year

"FLOOD DISTURBANCE" Flood event affecting reach at some point between spring and fall or late fall previous year

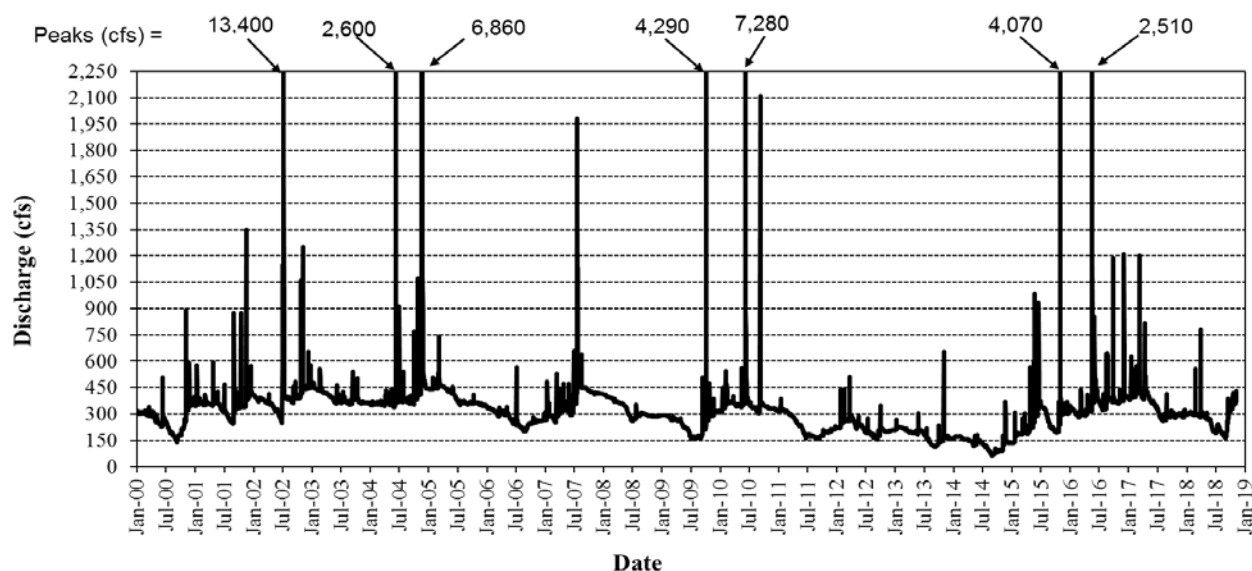

Figure 9. Comal River hydrograph presented as daily discharge over the biological monitoring period.

Table 5 shows the total aquatic vegetation (m^2) present in each of the three study reaches in the San Marcos system over time. Average years for the San Marcos River were determined as any year that exhibited over 140 cfs total system discharge throughout the majority of the year. The 140 cfs value was selected as it is the long-term average flow management objective specified in the HCP (EARIP 2011). Figure 10 depicts the San Marcos River hydrograph over the biological monitoring time period which also includes daily average peak flows and dates experienced.

Table 5. Total Aquatic Vegetation in the Spring and Fall per reach on the San Marcos System over time

| Season | Spring Lake Dam reach | | | City Park reach | | | I35 reach | | |

"AVERAGE YEAR" Total System discharge of >140 cfs throughout the year

"DROUGHT YEAR" Total System discharge of < 140 cfs discharge for most of the year

"FLOOD DISTURBANCE" Flood event affecting reach after fall sampling period

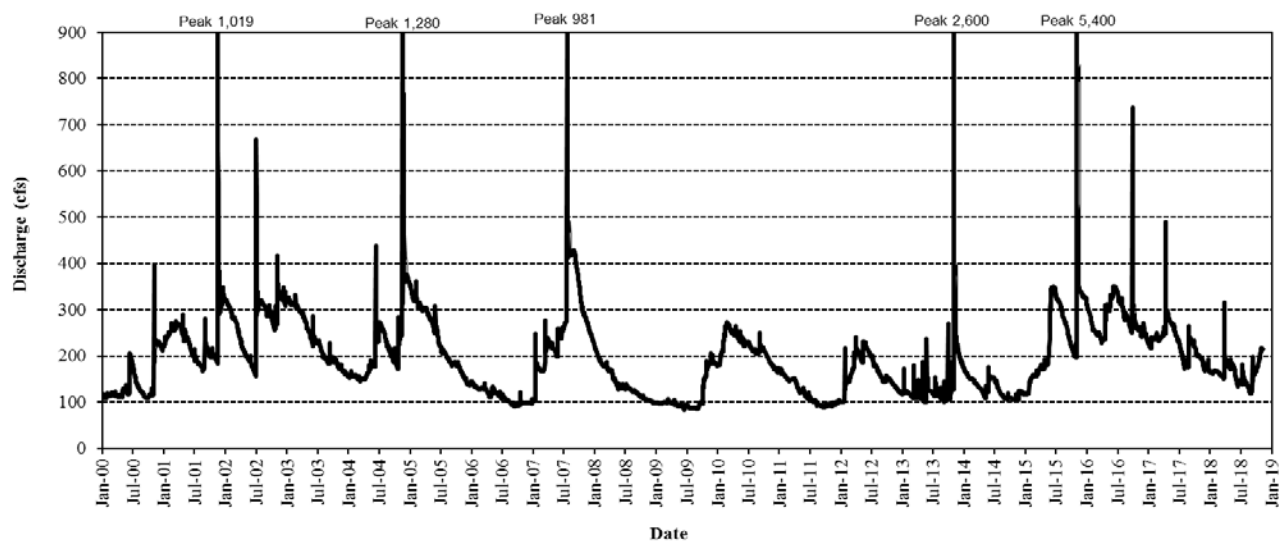

Figure 12. San Marcos River hydrograph presented as daily discharge over the biological monitoring period.

Table 6 shows the percentage retention in aquatic vegetation observed from spring to fall for average and drought years as well as individually for 2018. As evident in Table 6, only the Upper Spring Run and Landa Lake sample reaches showed a decline in overall aquatic vegetation in 2018 from spring to fall, with the Upper Spring Run sample reach exhibiting the largest decline due primarily to a reduction in bryophytes. In the more channelized sections of the river with greater overall velocities, Old Channel and New Channel sample reaches, the lower discharge observed in the fall typically results in greater amounts of aquatic vegetation (over 100% retention indicating increases). The Old Channel sample reach is bordered by private property and thus, limited to no recreation occurs in this reach. For the Old Channel sample reach, the 663 m² of *Hygrophila* purposely removed during summer 2018 as part of the HCP restoration program was not counted against the incidental take calculation. At first, the New Channel increase in aquatic vegetation from spring to fall seems odd considering the high level of recreation that occurs in this sample reach. However, this stretch of the New Channel is deep and most all the recreation is tubing that occurs on the surface. Over the years, the majority of aquatic vegetation disturbance in the deeper portions of the New Channel has been from pulse scour events rather than recreation.

Table 6. Percentage Retention of aquatic vegetation from Spring to Fall per sample reach per system.

| Scenario | Percentage Retention in Aquatic Vegetation from Spring to Fall | | | | | | |
|------------------------------|--|------------|-------------|-------------|----------------------------------|-----------|------|
| | Comal System Sample Reaches | | | | San Marcos System Sample Reaches | | |
| | Upper Spring Run | Landa Lake | Old Channel | New Channel | Spring Lake Dam | City Park | I35 |
| Average Flow Condition Years | 84% | 96% | 105% | 128% | 88% | 89% | 105% |
| Drought Years | 52% | 92% | 103% | 123% | 73% | 77% | 101% |
| 2018 Actual | 67% | 92% | 153% | 158% | 89% | 79% | 101% |

In the San Marcos system, both the Spring Lake dam the City Park sample reaches experienced declines in aquatic vegetation from spring to fall in 2018 (Table 6). During average and drought conditions observed to date, the same trend holds for these two reaches while aquatic vegetation in the I35 reach is more consistent year-round.

Table 7 shows the conversion process from percentage retention between spring and fall aquatic vegetation during average years when compared directly to 2018. Using the Upper Spring Run sample reach as an example, there is an 84% retention during average years. This implies that under average conditions a 16% decline in aquatic vegetation is observed from spring to fall each year. This amount is considered a pre-HCP condition because 1) it is calculated based on routine conditions prior to the HCP, and 2) during average years, a lot of HCP measures would not be actively engaged. As such, the difference in retention ($84\% - 67\% = 17\%$) is the value used to assess the overall loss (or gain) of Fountain Darter occupied habitat within this river section. The total Fountain Darter occupied habitat designated for the Upper Spring Run section is 6,009 m². The 17% difference from the reach is applied to the 6,009 m² from the entire section resulting in a habitat impact of 1,046 m². For this incidental take assessment, the 1,046 m² is considered the amount of habitat that was impacted by the HCP Measures and Drought category for this particular river section.

Table 7. Total Impacted Area (m²) for the Fountain Darter based on percentage retention of aquatic vegetation from Spring to Fall per sample reach per system.

| Scenario | Percentage Retention in Aquatic Vegetation from Spring to Fall | | | | | | |
|---|--|------------|-------------|-------------|----------------------------------|-----------|-------|
| | Comal System Sample Reaches | | | | San Marcos System Sample Reaches | | |
| | Upper Spring Run | Landa Lake | Old Channel | New Channel | Spring Lake Dam | City Park | I35 |
| Average Flow Condition Years | 84% | 96% | 100% | 100% | 88% | 89% | 100% |
| 2018 Actual | 67% | 92% | 153% | 158% | 89% | 79% | 101% |
| | HABITAT CALCULATIONS applied to river sections | | | | | | |
| Difference between Average and 2018 (%) | 17% | 4% | 0% | 0% | 0% | 10% | 0% |
| Total Fountain Darter Occupied Habitat (m ²) per entire river section | 6,009 | 56,306 | 23,125 | 20,959 | 1,873 | 33,113 | 6,834 |
| 2018 Total Impacted Area (m ²) | 1,046 | 2,310 | 0 | 0 | 0 | 3,188 | 0 |

As evident in Table 7, the Upper Spring Run and Landa sections exhibited impacted habitat conditions in 2018 on the Comal System. It should be noted that benefits from increased aquatic vegetation were not considered in this analysis. As such, all percentage retentions greater than 100% in Table 6 were adjusted to 100% in Table 7 for the determination of impacted habitat. In the San Marcos system, only the City Park reach showed a reduction in percentage retention from spring to fall in aquatic vegetation in 2018 beyond the average condition and thus, resulted in impacted habitat within that San Marcos River section.

Comal Springs Invertebrates:

To calculate the impacted habitat area for the Comal Springs riffle beetle, Comal Springs dryopid beetle, and Peck's Cave amphipod, areas of disturbance in 2018 (not including the HCP mitigation and restoration measures assessed separately) were assessed and area of impact quantified by overlapping area of

disturbance and occupied habitat. The occupied habitat maps for each of the Comal invertebrates are described in SECTION 1 and displayed in Appendix A. No critical low flows occurred during 2018 which allowed Comal invertebrate occupied habitat to remain inundated and supported by spring flow and flowing water throughout the year. As such, there was no take calculated for HCP measures and drought per established methodology. As in previous years no attempt was made to characterize subsurface habitat in this assessment.

San Marcos salamander:

As San Marcos salamander habitat below Spring Lake Dam and in Spring Lake remains fairly consistent from spring to fall, there was no attempt to quantify habitat changes similar to the Fountain Darter aquatic vegetation assessment. Additionally, there was no drying of surface habitat in the San Marcos system in 2018. As such, there was no quantification of disturbance using exposed surface area overlapping with occupied habitat. Therefore, the only known disturbance of occupied San Marcos salamander habitat in 2018 was from recreational activities below Spring Lake dam. As there is not a quantification of recreation in this sample reach, the percentage of retention of aquatic vegetation in the Spring Lake dam reach calculated for the Fountain Darter was used (as in each previous year) for the San Marcos salamander as a surrogate for disturbance. As shown in Table 7, there was an increase in aquatic vegetation retention in the Spring Lake Dam study reach during 2018 compared to average conditions resulting in no calculated impact to San Marcos salamander habitat below the dam.

Texas blind salamander: There is no surface habitat documented in the Item M assessment (SECTION 1) for the Texas blind salamander. There were no aquifer impacts noted via HCP measures or drought in 2018, and thus, no impacted habitat is reported for the Texas blind salamander in this assessment.

INCIDENTAL TAKE CALCULATIONS

The next step in the analysis is converting the impacted habitat area to incidental take of individuals so that a comparison can be made to the ITP permit. It is understood and should be emphasized that multiple ways of making a conversion from habitat area to incidental take can be performed, all of which involve a level of subjectivity and professional judgment. Based on USFWS acceptance following the first five annual assessments, the calculations for 2018 were conducted in the same manner.

In 2018, incidental take was again scaled in accordance with the condition of the system at that particular time. For instance, incidental take caused by a reduction of 10% of the occupied habitat in the system is not the same proportionally to a condition where 40%, 70%, or 90% of the occupied habitat is removed from the system. The rationale is that when only a small amount of habitat is removed, a large portion of quality habitat remains for the covered species to utilize. However, when larger portions of occupied habitat are reduced, the situation inherently becomes more stressful for the individuals. The word stressful is important in that take is more than just mortality as discussed at the start of this memorandum. In the Biological Opinion, the USFWS defines Take as “.... to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harass is further defined by the Service as an intentional or negligent act or omission which creates the likelihood of injury to a listed species by annoying it to such an extent as to significantly disrupt normal behavioral patterns, which include, but are not limited to, breeding, feeding and sheltering (50 CFS §17.3). Harm is also further defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by impairing behavioral patterns, including breeding, feeding, and sheltering.”

To explain the concept of non-proportional take as occupied habitat is reduced, it is important to start with mortality, but as described in the original HCP take assessment, incidental take goes beyond mortality.

Habitat disturbances including physical (aquatic vegetation, silt-free substrate, etc.) and chemical (standard water quality parameters such as water temperature and dissolved oxygen) play a role in incidental take calculations as well. This is important in that one of the further definitions of “Harass” is that it annoys the individual or modifies its habitat to such an extent that behavior patterns (including breeding) are impaired. Of course there are other behavioral components that may be disrupted either through direct annoyance of the individual or through habitat modifications, such as feeding and sheltering. During HCP measures and drought, the loss or modification of habitat described in the previous section by definition clearly caused take beyond mortality. Considering that mortality represents a very small proportion of that number, characterizing the remaining amount becomes very important.

For this assessment, we used the densities of the covered species recorded over time via EAA biological monitoring in both systems prior to HCP implementation. The USFWS approach used the average density for covered species from the same biological monitoring program to make calculations in the biological opinion in many instances. For this assessment, the density statistics were broken down further to explore the component of scaling incidental take as habitat conditions get worse. Table 8 shows the density statistics chosen for each of the covered species. The 25th, 50th (median), 75th, and 90th percentile along with the mean density are included. Furthermore, only the spring and fall data sets were used for these density statistics. The rationale is that under drought or following high-flow events the densities within aquatic vegetation types may not be representative of average conditions with which to apply to incidental take. Additionally, as more and more critical period (low and high) events get added, it skews the data set towards those events.

Table 8. Descriptive statistics of Covered Species density by System

| Covered Species | Density (individuals per m ²) Descriptive Statistics (Percentiles and Mean) | | | | |
|---|--|--------|-------|-------|-------|
| | 25 | Median | Mean | 75 | 90 |
| Fountain Darter | | | | | |
| Comal system | 1.50 | 6.00 | 11.35 | 15.50 | 29.30 |
| San Marcos system | 1.50 | 3.50 | 5.90 | 7.00 | 13.00 |
| Comal Springs riffle beetle | 6.60 | 9.10 | 10.71 | 12.40 | 19.38 |
| Comal Springs dryopid beetle^A | - | - | 0.10 | - | - |
| Peck’s Cave amphipod | 1.04 | 1.67 | 2.05 | 2.33 | 4.33 |
| San Marcos salamander | | | | | |
| San Marcos River | 3.00 | 6.00 | 6.08 | 8.50 | 10.5 |
| Spring Lake | 10.00 | 12.00 | 13.17 | 16.25 | 19.00 |

^A Too few collected to use full set of descriptive statistics

The same spring and fall sample sets were used for each covered species. Fountain Darter densities are presented by system and are comprised of drop net sampling in aquatic vegetation types used in the occupied habitat assessment. This approach deviates from the USFWS analysis in that only an average density calculated from both systems combined with all sample dates was included in the Biological Opinion. For this assessment, San Marcos salamander densities were developed from the quantitative snorkel/SCUBA sampling being conducted during biological monitoring in the San Marcos system. Densities within the San Marcos River and Spring Lake occupied habitat were broken out separately as done in the Biological Opinion.

Densities for the Comal Springs riffle beetles were generated from the cotton lure sampling at three locations (Spring Run 3, Western Shoreline, and Spring Island area). Densities for the Peck's Cave amphipod were generated from the drift net sampling conducted over the main orifices at Spring Run 1, Spring Run 3, and Spring Run 7. For the Comal Springs dryopid beetle, limited captures over time resulted in only using the mean presented in Table 8. The Biological Opinion estimated the total surface population of Comal springs dryopid beetles in the Comal Spring system to be 1,839 individuals (USFWS 2010). To calculate their incidental take, they used a 5%, 10% rule based on an even distribution of individuals to come up with 9 individuals ($1839 \times .05 \times .10 = 9.2$). In doing so, the underlying assumption forced was that the overall area was 1,839 square feet or 1 individual per square foot. One individual per square foot equals 0.09 per m². Although the biological monitoring data has limited Comal Springs dryopid beetle observations, the calculated mean density of 0.10 individuals per m² is in line with the Biological Opinion estimate.

To account for a scaled approach for calculating incidental take (increased impacts with increased levels of habitat loss); the following schedule (Table 9) was used to determine which density statistic to multiply by impacted habitat area to generate the incidental take estimate. The schedule is based on remaining occupied habitat per covered species per system. For example, if 9% of the total occupied habitat was impacted for the Fountain Darter in the Comal system that would leave 91% of the occupied habitat for the Fountain Darter. For the incidental take calculation, the 25th percentile density for the Fountain Darter (1.5 darters per m², Table 8) would be used to multiply against the total impacted area.

Table 9. Density assignment schedule based on remaining occupied habitat

| Remaining Occupied Habitat Percentage | Corresponding Density Statistic |
|---------------------------------------|---------------------------------|
| 100 to 75 | 25% |
| 74 to 50 | Median |
| 49-25 | Mean |
| 24-10 | 75% |
| 9-0 | 90% |

No standard water quality parameters were outside of a suitable range for the covered species in 2018, thus they were not considered for causes of incidental take in this assessment. Figures 14 and 15 show water temperature ranges observed in each system over the course of 2018.

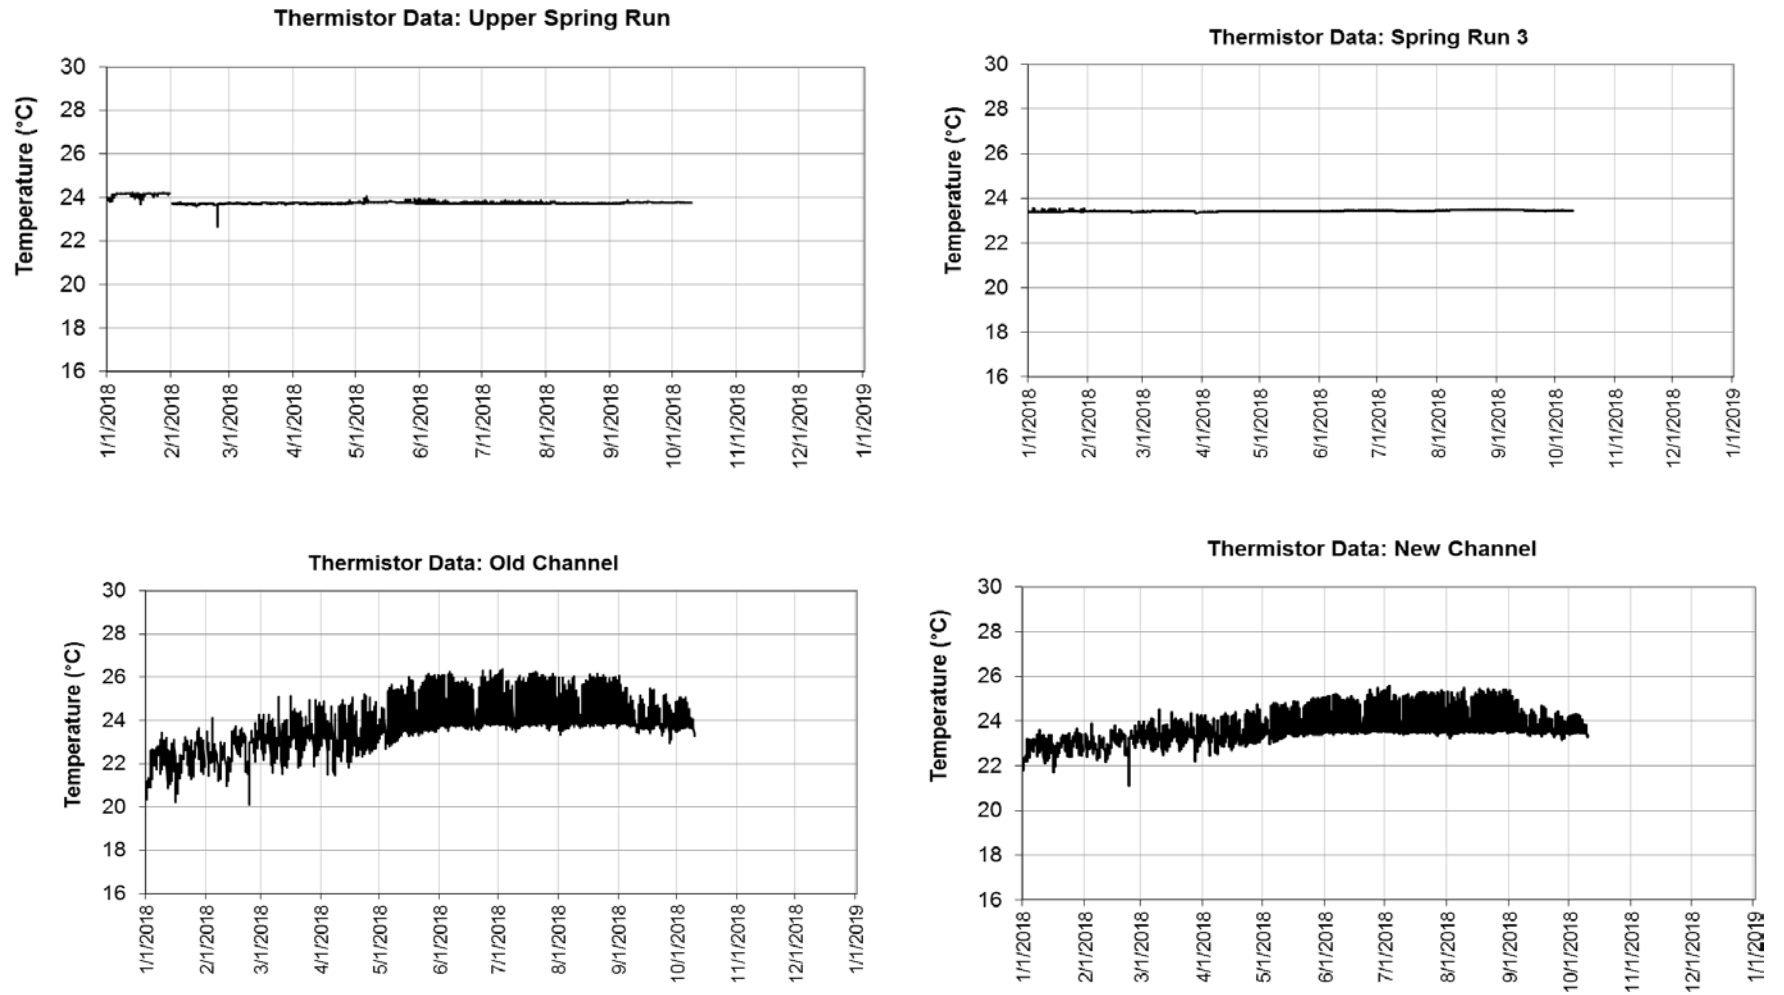

Figure 14. Thermistor data collected during 2018 at four select sites extending upstream to downstream in the Comal System.

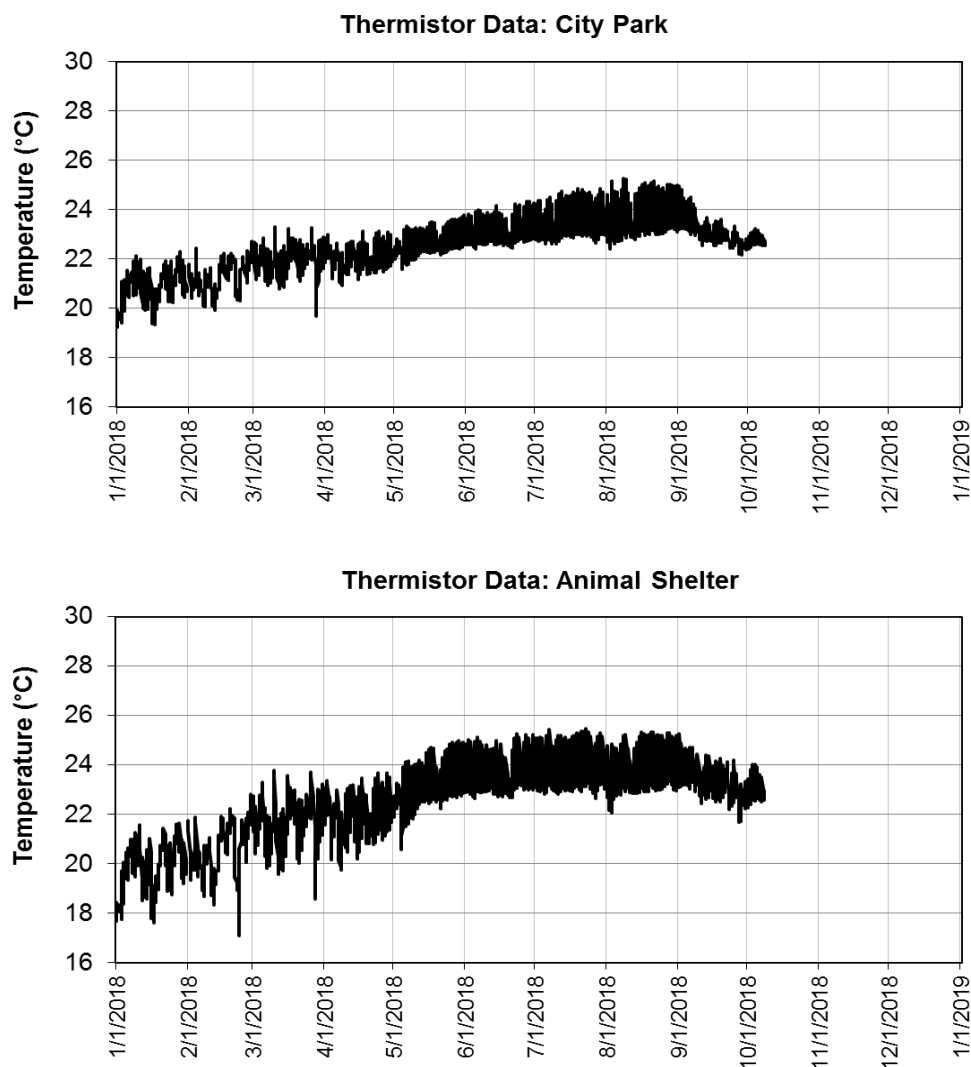

Figure 15. Thermistor data collected during 2018 at City Park and Animal Shelter reaches of the San Marcos River.

Fountain Darter:

Table 10 shows the incidental take calculated for the Fountain Darter in the Comal system and San Marcos system (San Marcos River and Spring Lake) relative to HCP mitigation and restoration activities as well as the HCP measures and drought. In all instances the percentage of impacted areas was less than 15% of the total occupied habitat and thus the 25th percentile density was applied to each reach.

It is important to keep the two categories (HCP mitigation / restoration and HCP measures / drought) separate in the analysis. The rationale is that HCP mitigation and restoration activities have a mandate to stay under 10% of the total occupied habitat or cease. Additionally, there is another clause in Item M of the ITP that these activities should cease under certain low-flow triggers if undesirable impacts are encountered. As such, any impacts from the HCP measures or drought should be calculated independently for an accurate comparison in future drought years.

Table 10. Calculated Incidental Take for the Fountain Darter per system based on impacted habitat.

| FOUNTAIN DARTER PARAMETERS | COMAL SYSTEM | | SAN MARCOS SYSTEM | | | |
|--|---------------------------------|---------------------------|------------------------------------|------------------------------|------------------------------------|------------------------------|
| | | | San Marcos River | | Spring Lake | |
| | HCP Mitigation / Restoration | HCP Measures / Drought | HCP Mitigation / Restoration | HCP Measures / Drought | HCP Mitigation / Restoration | HCP Measures / Drought |
| 2018 Impacted Area (m ²) | 1,599 | 3,356 | 4,763 | 3,188 | 0 | 0 |
| Total Occupied Habitat (m ²) | 106,399 | 106,399 | 41,820 | 41,820 | 53,593 | 53,593 |
| % of Occupied Habitat Impacted | 1.50% | 3.15% | 11.39% | 7.62% | 0.00% | 0.00% |
| Corresponding Habitat Percentile Density (individual/m ²) | 1.50 | 1.50 | 1.50 | 1.50 | -- | -- |
| Water Temperature Percentile Density adjustment | N/A | N/A | N/A | N/A | -- | -- |
| 2018 Incidental Take Estimate | 2,399 | 5,034 | 7,145 | 4,783 | 0 | 0 |
| 2018 TOTAL INCIDENTAL TAKE PER SYSTEM | 7,432 | | 11,927 | | | |

Comal Springs invertebrates:

There was no impacted habitat reported for the Comal Springs invertebrates in 2018, thus no incidental take was calculated for these species in 2018.

San Marcos salamander: Table 11 shows the incidental take calculated for the San Marcos salamander in the San Marcos system (San Marcos River and Spring Lake) relative to the HCP mitigation and restoration activities as well as the HCP measures and drought. In all instances the percentage of impacted areas was less than 1% of the total occupied habitat and thus the 25th percentile density was applied. In 2018, all impacted area was below Spring Lake Dam so only the San Marcos River 25th percentile density was applied.

Table 11. Calculated Incidental Take for the San Marcos salamander based on impacted habitat.

| SAN MARCOS SALAMANDER PARAMETERS | SAN MARCOS SYSTEM | | | |
|--|------------------------------------|------------------------------|---------------------------------|------------------------------|
| | San Marcos River | | Spring Lake | |
| | HCP Mitigation / Restoration | HCP Measures / Drought | HCP Mitigation / Restoration | HCP Measures / Drought |
| 2018 Impacted Area (m ²) | 15 | 0 | 0 | 0 |
| Total Occupied Habitat (m ²) | 1,530 | 1,530 | 990 | 990 |
| % of Occupied Habitat Impacted | 1.0% | 0.0% | 0.0% | 0.0% |
| Corresponding Percentile Density (individual/m ²) | 3.00 | -- | -- | -- |
| 2018 Incidental Take Estimate | 45 | 0 | 0 | 0 |
| 2018 TOTAL INCIDENTAL TAKE | 45 | | | |

Texas blind salamander: There was no impacted habitat reported for the Texas blind salamander in 2018, thus no incidental take was calculated for the Texas blind salamander in 2018.

COMPILATION OF RESULTS AND SUMMARY

Table 12 summarizes the 2018 impacted habitat area and incidental take attributed to the HCP relative to the ITP permit amount. Per the established methodologies, only the fountain darter and San Marcos salamander experienced incidental take during 2018.

Table 12. Summary of Impacted Habitat (m²) and Incidental Take for HCP Covered Species compared against ITP Permit Amounts.

| COVERED SPECIES PER SYSTEM | IMPACTED HABITAT (m²) | | HABITAT 2018 TOTAL (m²) | INCIDENTAL TAKE | | 2018 INCIDENTAL TAKE TOTAL | ITP Maximum Permit Amount | ITP Permit Maximum minus (combined first 6 years) |
|------------------------------|------------------------------|------------------------|-------------------------|------------------------------|------------------------|----------------------------|---------------------------|---|
| | HCP Mitigation / Restoration | HCP Measures / Drought | | HCP Mitigation / Restoration | HCP Measures / Drought | | | |
| COMAL SYSTEM | | | | | | | | |
| Fountain Darter | 1,599 | 3,356 | 4,955 | 2,399 | 5,034 | 7,432 | 797,000 | 736,334 |
| Comal Springs Riffle Beetle | 0 | 0 | 0 | 0 | 0 | 0 | 11,179 | 8,887 |

| Texas Blind Salamander | 0 | 0 | 0 | 0 | 0 | 0 | 10 | 10 |
| Comal Springs Riffle Beetle | 0 | 0 | 0 | 0 | 0 | 0 | n/a | n/a |
| Comal Springs Dryopid Beetle | 0 | 0 | 0 | 0 | 0 | 0 | n/a | n/a |

The calculated value for the Fountain Darter in the Comal system was slightly higher in 2018 than observed during 2017. The primary cause for the increase for the Fountain Darter in the Comal system was lower discharge conditions in 2018 which resulted in larger spring to fall aquatic vegetation (habitat) reductions primarily in the Upper Spring Run section. In 2018, all invertebrate restoration activities occurred on shore resulting in no calculated incidental take for the listed Comal invertebrates. For the San Marcos system, incidental take for the Fountain Darter also went up slightly in 2018 compared to 2017. The slight increase in the San Marcos system was due to a larger footprint for HCP mitigation primarily native aquatic vegetation restoration in 2018 relative to 2017. The Texas wild-rice exclusion zone implemented for 21 days in the summer below Spring Lake dam resulted in the minor amount of incidental take being calculated for the San Marcos salamander.

When examining 2018 results, conditions are in line with those characterized in the Biological Opinion as an average year. As such, we are confident the incidental take numbers summarized in Table 12 and documented in this memorandum continue to justify the data sets used and methodologies employed in 2018 relative to performing an incidental take assessment within the context of the Biological Opinion. It is understood that adjustments to data sets and/or methodologies may be employed based on feedback from the USFWS, HCP Science Committee, HCP participants, or others as deemed appropriate by the EARIP.
