

## **2020 GROUNDWATER RECHARGE**

Recharge to the Edwards Aquifer originates as precipitation over the contributing and recharge zones of the aquifer, or as interformational flow from adjacent aquifers. The EAA maintains a joint funding agreement with the U.S. Geological Survey (USGS) to provide surface recharge estimates for eight of the nine major drainage basins with streams that flow on to the Edwards Aquifer recharge zone (Figure 1). Recharge is estimated using a water-balance method that relies on precipitation and streamflow measurements across the region. Based on the USGS methodology, the Guadalupe River Basin does not appear to provide significant recharge to the Edwards Aquifer, so recharge is not estimated for that drainage basin.

Table 1 lists estimated annual recharge by drainage basin for the period of record from 1934 through 2020 based on USGS calculations. Estimates of total annual recharge ranged from 43,700 acre-feet during the drought of record in 1956 to 2,486,000 acre-feet in 1992, as shown in Figure 2. In 2020, total estimated recharge was 184,000 acre-feet, which is below both the mean annual recharge of 700,000 acre-feet and the median annual recharge of 556,000 acre-feet for the period of record.

The EAA currently operates four recharge dams in Medina County on the Edwards Aquifer Recharge Zone (yellow triangles in Figure 1). The total amount of enhanced recharge for each site is estimated using data from stage recorders near these structures. Enhanced recharge refers to the estimated amount of additional recharge attributable to these structures above the amount of recharge that would have occurred naturally in the absence of these structures. Table 2 shows the estimated annual enhanced recharge for each site starting in 2014. Recharge estimates in Table 2 prior to 2014 reflect total annual recharge at each dam site. No estimated enhanced recharge (zero acre-feet) was recorded for these structures in 2020. Enhanced recharge is generally a small fraction of total recharge and tends to be greater in wet years when natural recharge is also high.

Recharge resulting from interformational flow in adjacent aquifers such as the Trinity Aquifer is not estimated annually. Estimates associated with interformational flow are variable and range from 5,000 to 100,000 acre-feet per year in different publications. Estimated interformational recharge is not included in recharge values provided in this report. Edwards Aquifer Authority is presently conducting an Interformational Flow Study that may help to better quantify the amount of water that may enter the Edwards Aquifer from Trinity Aquifer formations to the north.

Figure 1. Major Drainage Basins and Edwards Aquifer Authority-Operated Recharge Structures in the San Antonio Segment of the Balcones Fault Zone Edwards Aquifer.

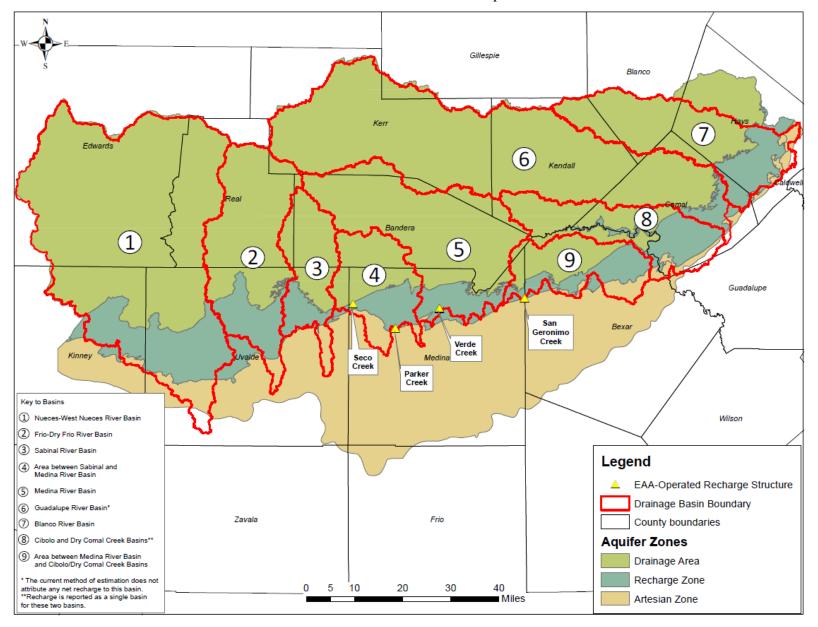

Table 1. Estimated Annual Groundwater Recharge to the San Antonio Segment of the Balcones Fault Zone Edwards Aquifer by Drainage Basin, 1934–2020 (in thousands of acre-feet)

Year	Nueces River/ West Nueces River Basin	Frio River/ Dry Frio River Basin	Sabinal River Basin	Area between Sabinal River and Medina River Basins	Medina River Basin	Area between Medina River and Cibolo Creek/ Dry Comal Creek Basins	Cibolo Creek/Dr y Comal Creek Basin	Blanco River Basin	Total <sup>a</sup>

Data source: Unpublished Edwards Aquifer Authority files (2020).

a = Written communication from USGS, San Antonio Subdistrict Office.

b = Determined by linear-regression analysis using rainfall data and historical recharge data.

c = Linear-regression analysis indicates zero recharge; however, one recharge event was observed that was estimated to have

d = Part of 2001 recharge estimate provided by HDR Engineering, Inc. (unpublished report).

--- = Years prior to construction of recharge structure.
